

This is a digital copy of a book that was preserved for generations on library shelves before it was carefully scanned by Google as part of a project to make the world's books discoverable online.

It has survived long enough for the copyright to expire and the book to enter the public domain. A public domain book is one that was never subject to copyright or whose legal copyright term has expired. Whether a book is in the public domain may vary country to country. Public domain books are our gateways to the past, representing a wealth of history, culture and knowledge that's often difficult to discover.

Marks, notations and other marginalia present in the original volume will appear in this file - a reminder of this book's long journey from the publisher to a library and finally to you.

### Usage guidelines

Google is proud to partner with libraries to digitize public domain materials and make them widely accessible. Public domain books belong to the public and we are merely their custodians. Nevertheless, this work is expensive, so in order to keep providing this resource, we have taken steps to prevent abuse by commercial parties, including placing technical restrictions on automated querying.

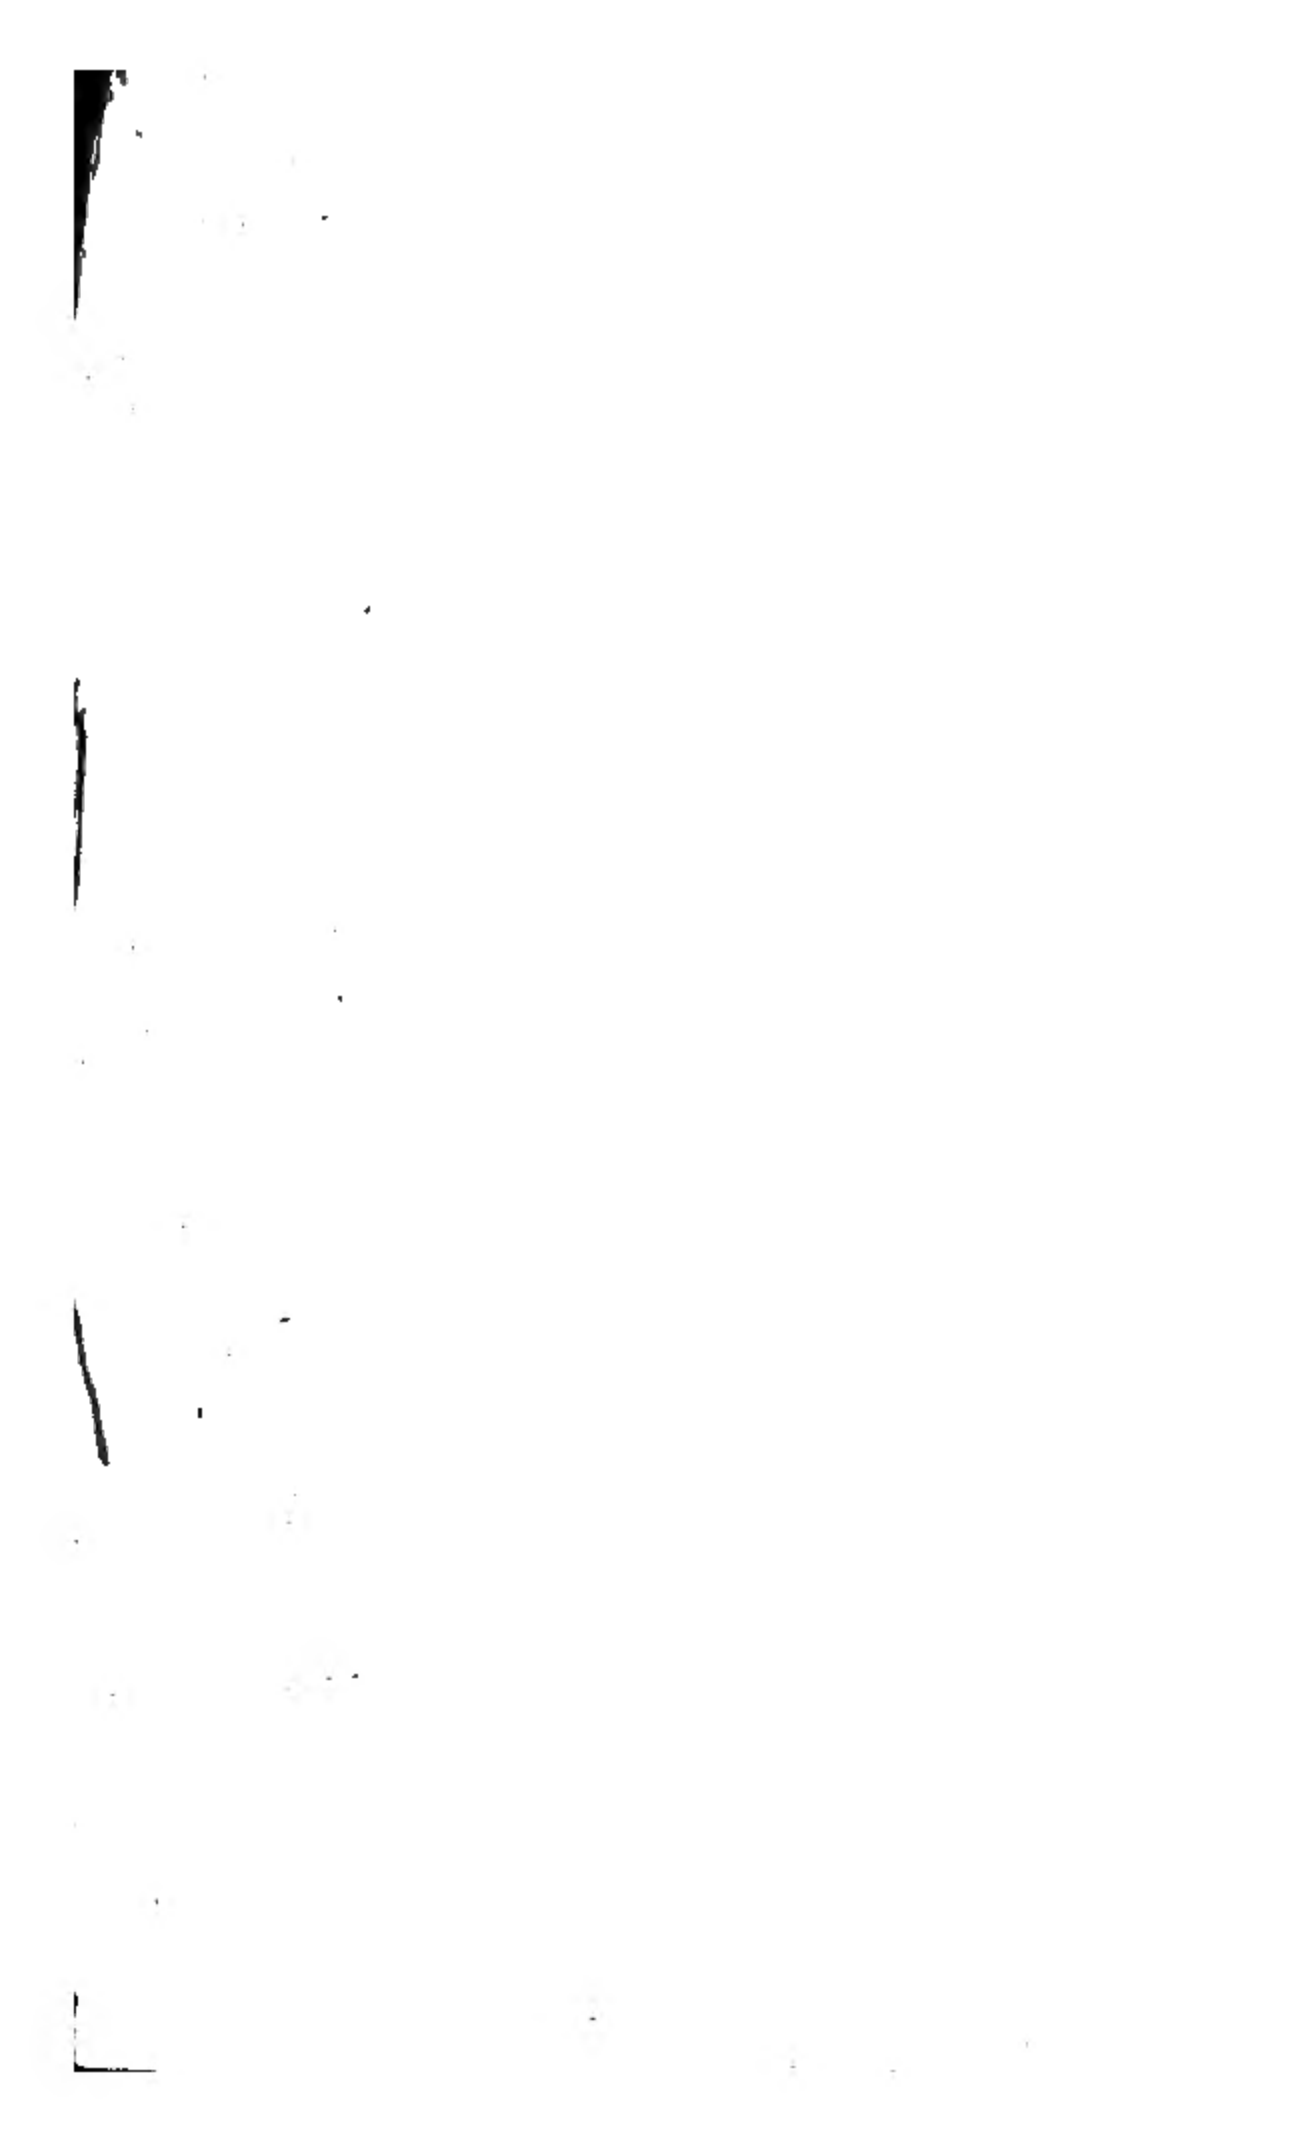

We also ask that you:

- + *Make non-commercial use of the files* We designed Google Book Search for use by individuals, and we request that you use these files for personal, non-commercial purposes.
- + *Refrain from automated querying* Do not send automated queries of any sort to Google's system: If you are conducting research on machine translation, optical character recognition or other areas where access to a large amount of text is helpful, please contact us. We encourage the use of public domain materials for these purposes and may be able to help.
- + *Maintain attribution* The Google "watermark" you see on each file is essential for informing people about this project and helping them find additional materials through Google Book Search. Please do not remove it.
- + *Keep it legal* Whatever your use, remember that you are responsible for ensuring that what you are doing is legal. Do not assume that just because we believe a book is in the public domain for users in the United States, that the work is also in the public domain for users in other countries. Whether a book is still in copyright varies from country to country, and we can't offer guidance on whether any specific use of any specific book is allowed. Please do not assume that a book's appearance in Google Book Search means it can be used in any manner anywhere in the world. Copyright infringement liability can be quite severe.

### About Google Book Search

Google's mission is to organize the world's information and to make it universally accessible and useful. Google Book Search helps readers discover the world's books while helping authors and publishers reach new audiences. You can search through the full text of this book on the web at <http://books.google.com/>

A  
COMPLETE SYSTEM  
OF  
PRACTICAL ARITHMETIC,  
(Both VULGAR and DECIMAL)

On an entire new Plan;

The DEFINITIONS, GENERAL RULES, and *many of*  
*the* EXAMPLES being VERSIFIED, and the whole  
made exceeding easy and familiar to the meanest  
Capacity, being done in such a Manner as to  
render the Study of ARITHMETIC *delightful*  
as well as instructive to both Sexes.

TO WHICH IS ADDED,

A large Collection of NEW QUESTIONS,  
with only the ANSWERS thereto;

The other EXAMPLES, or QUESTIONS, being many  
of 'em work'd at full length.

---

By THOMAS SADLER.

Teacher of the Mathematics in *Whitchurch, Shropshire.*

Author of the *Harvest Field Poem*, and of several

*Poetical and Mathematical Miscellanies, &c.*

---

ARITHMETIC *that useful curious Art*  
*Refines the Man and brightens ev'ry Part*  
ARITHMETIC! *by thy all pow'rful Aid*  
*Wealth is secur'd and all the Fruits of Trade*  
*We learn by FIGURES to demonstrate true*  
*And reason just by Precepts ever new.*

*For the Benefit of Youth, and other Persons  
who are desirous of being instructed in the most  
useful parts of the Mathematical Sciences.*

**T**HE AUTHOR of this Treatise, begs  
leave to acquaint his Friends and the  
Public, that he will continue (if health permit)  
to teach WRITING in all the hands practised  
in Great-Britain, ARITHMETIC (*Vulgar and  
Decimal*), according to the plan of this Trea-  
tise, by which he will engage to bring Youth  
on to the knowledge of Figures, in half the  
time taken up by some Teachers.) BOOK-  
KEEPING, GEOMETRY, TRIGONOMETRY,  
MENSURATION in all its various parts,  
GAUGING, DIALING, GEOGRAPHY, and  
the use of the GLOBES; (*having purchased a  
new pair for that purpose*) ALGEBRA, FLUX-  
IONS, ASTRONOMY, and NAVIGATION,  
according to the best Methods used by the  
most celebrated Authors.

*Note.* Gentlemen's Estates Surveyed, and  
Mapped in the best manner, Marl-pits and  
Hay-recks Measured, and all kinds of Artifi-  
cers' Work, by the *Author*, (on reasonable  
terms) by whom Youth will be made fit for  
Sea, Excise, or any public Office, &c. &c.

*To the Honourable Sir W A T K I N  
W I L L I A M S W Y N N E, Bart.  
and Knight of the Shire, for the  
County of Salop.*

H O N <sup>D</sup> S I R,

**T**H E Consideration of that  
glorious Family from which  
You spring, which has ever stood  
foremost in the Patronage and Sup-  
port of whatever may be deem'd  
beneficial, or useful to the Public  
Weal, joined to that Candour and  
Urbanity which You so eminently  
possess, emboldens the Author of  
this *Arithmetical Treatise*, humbly  
to beg leave to shelter it under YOUR  
PATRONAGE, which he hopes will  
be found to be formed upon a Plan  
at once easy, useful, and pleasant;  
and in short, to answer the end  
the Author intends, which is to  
lead

lead Youth in an agreeable manner, to the study of a thing of such public and private Utility. These ends the Author flatters himself will be answered by a careful perusal of the following Sheets, by those for whose Use they were principally drawn up, *viz.* the *Tyros* in *Arithmetic*, several Gentlemen eminent in the Mathematics having perused them with Approbation.—Not to trespass upon YOUR HONOUR'S Time, and to wave the hacknied Track of Dedication, (tho' I cou'd dilate with pleasure upon the *admired Character* of *Sir WATKIN WILLIAMS WYNNE*.) I beg leave to subscribe myself

YOUR HONOUR'S most obedient,

humble Servant,

T. S A D L E R.

# THE PREFACE.

**T**HE use of ARITHMETIC is so great in all common affairs of life, and amongst all degrees of people, that no man can say without erring from truth,—“ARITHMETIC is of no use, or consequence to me, I mind it not.” The Statesman, even an Emperor himself must call in its aid at certain times, and upon sundry occasions. If it were not for the knowledge of *Figures*, what would become of Trade, Commerce, &c.

What induced me to write a Treatise of PRACTICAL ARITHMETIC after so many excellent Authors who have wrote before me, were the following motives.

First, I observed none had attempted to write upon the plan I offer to the public, *i. e.* of versifying the general Rules for the ease of Memory. And Secondly, few had given the Operations work'd at Length: This was an article I have heard a great many complain of, even Teachers themselves.

As to the Work itself, it is laid down upon the best foundation I cou'd procure from the most celebrated Authors; the Rules (tho' *versifie*) are built upon the best principles now taught and practised by the most eminent Masters of our private or public Academies, or Schools in this Kingdom; every difficulty is explained in the most concise and best methods, and the whole of the performance made perfectly easy to be understood, (even by the meanest capacities) by precepts so naturally easy, as to lead Youth on without the help of any other Instructor — By the help of this Treatise, any young man of a

tolerable capacity, may in a short time make himself master of the most difficult parts of ARITHMETIC.

I have often observed many young people of the lower class, (whose parents were not able to give them a proper Education) have by their own Industry, Ingenuity, and the help of good Authors, become very good Accomptants, got preferment, and advanced themselves to very great fortunes. It must be allowed to be no small difficulty for a person in a servile state, who earns his bread (perhaps) by the sweat of his brow, to make much proficiency in the Sciences, but where wou'd all the *Mæcenases* of the age be, if the few spare hours allotted to sleep were not on their side? To answer which we'll say, "buried in oblivion."—But it is well known from the writers of all ages, that the *Goddeſs of Wiſdom*, does not always deſcend in a golden ſhower, or crown her favourites with diadems and coſtly pearls. No! rather with knowledge, for even the loweſt and meaneſt Cottager may wear her Laurels, as ſoon as the greateſt Monarch upon Earth. This I hope every impartial Reader will allow; to favour which, I ſhall give a quotation from a letter I received many years ago, from a learned gentleman (Mr. *Tarrat* of *Epfom*) whoſe name is well known to the public. "*A perſon's elevation*" (ſays my friend) "*moſtly ariſes from accidents.*—*Ferguson is a ſelf taught Philoſopher.*—"*Martin the ſame. Simpson was a very poor Weaver,* "*and by an extraordinary accident was brought to* "*London, and introduced to the Academy of Wool-* "*wich. Thomas Grimmet, a Ship Carpenter in the* "*Yard at Deptford, by an accident of a broken thigh,* "*was introduced to copy Accounts in an Office, became* "*a very good Mathematician, a Meaſurer in the Yard* "*and died worth £14000, a few years ago; I could* "*enumerate five hundred inſtances if I had paper,* "*room and time.*"

It

## The Preface.

vii!

It may be said with regret, that too little regard is paid to *both sexes*, (especially the *female*) in instructing or having them instructed, by persons properly qualified for such a purpose, in so noble, so extensive, and useful a branch of learning as ARITHMETIC. — “ARITHMETIC,” (says the celebrated Mr. Malcolm †) “*is a subject of that extent, that in some respects it can never be exhausted, and of that value as to deserve all that study and pains that can be bestowed upon it.*” Mr. Emerson says also, “*No Business can be carried on without the help of NUMBERS, no Trade or Commerce exercised without REGULAR ACCOMPTS, so that in all situations of life, ARITHMETIC is a necessary accomplishment.*” Mr. Locke says in his Essay on Human Understanding, “*All those should be taught who have time and opportunity, the Art of NUMBERS, not so much to make them Mathematicians, as to make them reasonable Creatures.* What a true conception of the powers of ARITHMETIC possessed Solomon, when he uttered that just assertion. “*Thou O Lord hath disposed all things in Measure, Number and Weight.*” From the above citations we behold the intrinsic value of NUMBERS, in the words of the greatest Philosophers that ever existed, whose monuments of refined knowledge will stand the test of all ages. Then what a pity it is, that parents whose abilities and fortunes will enable them, would be careful to have their children well instructed in such necessary attainments.

It is well known that the genius of the *fair Sex* is as penetrating as ours, a Lady of fortune by the help of NUMBERS, can adjust her accompts with her Steward; also, the Mechanic, Tradesman, or Farmer's Wife is able to book and accompt in her Husband's absence. To encourage my Female Readers, I shall

---

† In his Preface to his Arithmetic, page 1.

give them a Poetical Opinion of a *learned Lady*, from one of her Letters of Correspondence written to me some years ago. She descants thus,

“ *How few alas ! in this degen’rate age,  
 “ Employ their noble faculties, and pow’rs  
 “ In scientific knowledge, — rich supplies  
 “ From thence we draw ; nor will the Fountain cease  
 “ To flow, ’till time itself shall be no more,  
 “ And nature sinks beneath the gen’ral fire.*  
 PHILLIPS.”

Having for a series of upwards of twenty years, taken great delight in reading the Annual Publications, viz. the Diaries, Palladiums, and such delightful Miscellanies, I have observed the Questions (tho’ ever so intricate to be solved) when humourously versified, have tended greatly to the amusement of *both sexes*, only for the reading part ; much more entertainment must they give to the ingenious *Tyro* who can solve them. This was one motive why I proposed so many Examples in this Treatise in Verse, I did it purely to excite the learners attention to the study of FIGURES, OR ARITHMETIC ; to mix knowledge with delight, and by that means entice as it were the ingenious learners to climb the most difficult precipice with pleasure. I think nothing can strike a deeper impression upon the mind, than having the Rules delivered in Verse, and learned perfectly by heart ; this not only serves the present purpose, but is much stronger retained in memory, than a page of dry prose writing ; not by children only, but by adult persons also.

The Questions in Verse as they are humourous and innocent, I hope they will be looked upon also, as proper and agreeable recreations for *both sexes*. — Some of these Questions perhaps may be thought too long for a Master to copy out to his Pupils, but this  
 is

is quickly remedied, by giving the subject of the Example in Prose; but more delightful, as well as beneficial it will be, for the ingenious Pupil, to write or copy these out himself, as well as the Definitions and Rules: all this will add to a creative mind, and improve the use of the PEN, as well as FIGURES.— It is a thing almost impossible for Masters (even of the ripest judgment) in large Schools to teach without the help of an Author; or, even when there are several Pupils waiting with their performances to be examined, to perform their duty, without having the operations at hand to what they propose, by having the whole operation immediately open to the eye an error is soon discovered, and a deal of time saved; it is true when a Master knows the Answer, and his Pupil is wrong, he may check him, bid him go and find it out, but this will only curb his ingenuity, stupify his senses, lose his time, and be detrimental both to himself and Parents. In my humble opinion nothing comes up to encouragement, by giving youth a proper idea of the matter they have in hand, and then they will go thro' their performances with ease and perspicuity; according as their genius or inclination may lead them.

Perhaps some of our most eminent Teachers and Mathematicians may say, I have inserted too many operations at length, as this may be a means of encouraging dull and lazy boys to copy out their Answers, and by that means think to deceive the Master, but such kind of piracy may soon be detected. To remedy this, I have added a compleat collection of new Questions at the end of this Treatise, in every Rule, with only the Answers. Any of these Questions when given to the Pupil will soon put him to a stand; make him reflect on what he has done, and set his thoughts to work, to enquire into the true principles and nature of working his Question, as *per*  
Rule

*Rule*, but it wou'd be in vain to give a Pupil any of the Questions before he has got a perfect knowledge of the Rule to which they belong.

In this place I cannot help taking notice of the great use this Treatise must be, to those persons who have not time and opportunity, (and perhaps cannot afford) to have a Master's instruction; here they will see how every Example is, or ought to be done; and may quickly by their own application, make themselves complete masters of the whole Treatise.— Those persons also, who have negligently forgot what they have learned at school, may here quickly regain what they have occasion for, according as their business or situation may require.

As to the order of the Rules in this Treatise, I have placed them as I thought most properly they shou'd be learned; but every Master may use his own pleasure, and teach them in what form he likes best.

I have observed many good Authors take the method of transcribing many of their questions from other men's writings, without mentioning the name of the real Author, or to whom they were obliged for them; this is rather an unfair way of proceeding, in my opinion every author ought to shine in his own plumes; this occasioned my inserting the Authors names to the Promiscuous Questions, &c. In regard to proposing new Questions in ARITHMETIC, I must confess, it is almost impossible to frame any thing new, but what shall be similar to what has been wrote before by others; because the use and application of FIGURES is the same as in former ages; but then it must be allowed that new improvements have and will be made, and a new dress given to every Man's performance, perhaps as long as this world shall exist.

I must certainly expect, (when even the best of Authors,

thors, and most celebrated Mathematicians have done the same) to be carped at by some ill natur'd Critics, who wou'd endeavour to *throw down a Castle*, if but *one Stone* stood crooked in the *whole fabric*; but this will make but little impresson upon me, as I do not, pretend to such niceties. What I have done is purely for the benefit of the unlearned, and the instruction of our *British Youth*.—So I hope every impartial reader, and lover of truth, will judge for himself of the merits of this Performance; and if it meet with the approbation of my worthy subscribers, and the public in general; I shall not think I have spent so much labour in vain, but rejoice at having done any thing that may be serviceable, and for the good of my country.

By reason of the many indispensable avocations which prevented me from attending the press, my judicious Readers may perhaps find a few typographical errors and slips of the pen, which are scarce possible to be avoided in printing so large a Treatise as this; therefore (and as I have drawn up no *Errata*) I hope they will candidly excuse and correct what errors they may occasionally find herein, and that, as well as all other favours shall be gratefully acknowledged by

*Whitchurch*      *their most obedient humble Servant*  
*April 25th, 1773.*      **THOMAS SADLER.**

*On the Excellence and extensive Use of*  
**A R I T H M E T I C.**

---

*Hinc omne principium, huc refer exitum. Hor.*

---

**T**HE path by which aspiring mortals climb  
 To Wisdom's Fane, and compass truths sublime,  
 I sing — *Castalian Maids!* inspire my song,  
 Soft let the tuneful numbers roll along  
 As Spring-gales wafted from *Favonius'* wings,  
 And sweet as sounds that flow from *Delphian* strings.  
*ARITHMETIC's* my theme! — O heav'n born Fair!  
 (If science merit thy distinguish'd care)  
 Thou, *Pallas*, aid! — to heights untry'd before,  
 Indulgent Goddess! teach my thoughts to soar.  
*ARITHMETIC!* — The name can re-inspire  
 The languid *Muse's* half-extinguish'd fire:  
 Oh! cou'd that *Muse* on Eagle's pinions rise,  
 From this low Earth to yon' cerulean Skies;  
 Amidst siderial worlds *thy* praise I'd sing,  
 And with *thy* fame the distant spheres shou'd ring.  
*ARITHMETIC!* to *thee* we justly owe,  
 Whate'er of Arts, or Sciences we know;  
 From *thee* they spring, — on *thy* support depend;  
*Thou* art their *Primum Mobile* — and end.  
*Thy* various useful properties are known,  
 In ev'ry distant land from *Zone* to *Zone*,  
 Where truth prevails, and erudition's ray,  
 Darts on the soul, and yields a mental day:  
 But *Britain's* first thy just applause to sound,  
*Britain*, not less for arts than arms renown'd.  
 By *thee* her *NEWTON* rose aloft to fame,  
 And as the stars immortaliz'd his name,

By

*On the Excellence &c. of Arithmetic.*      xiii.

By *thee* fair *Commerce* lives, and kindly pours  
Un-number'd blessings on her sea-lav'd shores :  
With majesty benign the Goddess smiles,  
And crowns with opulence the *Queen of Isles*.  
Daughter of *Concord*! *thee* *Britannia* hails,  
Whose glories blaze beneath thy fost'ring sails,  
Whence to her temp'rate climes the fruits are hurl'd,  
Of hot *Golconda*, and the *Polar World*.—

*ARITHMETIC*! without thy pow'rful aid,  
Could Reason's keenest eye the gloom pervade,  
Where white-rob'd Truth her lovely form enshrouds,  
And veils her face in scientific clouds?

Reason unaided, at the best we find,  
The dawn of knowledge on the human mind ;  
But by *thy* pow'r the faculty divine,  
Improv'd with stronger rays begins to shine ;  
From truth to truth *thy* precepts point the way,  
'Till the weak twilight brightens into day.

So when hot *Sol* from *Thetis*' cold embrace  
Ascends, and in the East unveils his face,  
The gloomy shades recede before his eye,  
And perfect day-light blazes thro' the sky.

*All hail, BLEST ART*!— but Oh! my feeble lays,  
Degrade *the subject* I attempt to praise :

A theme so great — so noble, does require  
A *POPE*'s pure diction, and a *MILTON*'s fire.

Great *EMERSON*, whose energetic soul  
No space can bound—no obstacle controul ; —  
Whose learning will to latest ages shine,  
And stamp his name with honours half divine,  
Expatriates with delight, and still profound  
O'er all th' extensive mathematic round :

But where had been his fame without *thy* aid ?  
Interr'd beneath Oblivion's ten-fold shade !

'Twas *NUMBERS* gave his mighty genius birth,  
And made his thoughts aspire above the Earth.

Fam'd *HUTTON* too, in science deeply taught,  
With all his vast profundity of thought,

xiv. *On the Excellence &c. of Arithmetick.*

Without the help of *NUMBERS* ne'er had shone,  
Or made his curious, useful The'rems known.  
By *NUMBERS* taught the *Bards* divinely sing,  
And by soft *NUMBERS* charm the Lyric string.  
*PARENT of ARTS!* (esteem'd by great and small)  
Whose wide, unbounded use extends to all;  
'Tis *thine* to teach, and beautify the mind,  
'Tis *thine* to bless, and dignify mankind;  
—*Thine* by un-erring rules to ascertain  
The Merchant's treasure, and the Tradesman's gain.  
'Tis *thine* — but Ah! my utmost efforts fail,  
*Thy* worth — *thy* countless merits to reveal:  
'Tis not in language less than that divine,  
To tell what matchless excellence is *thine*!  
Hence may *thy Rules*, by *SADLER's* mode explain'd,  
Be learn'd with pleasure, and with ease retain'd:  
Hence *thy Examples* more and more admir'd,  
And *British* youth with emulation fir'd,  
Pursue *thy* precepts, with renew'd delight,  
'Till taught to reason well, and judge aright:  
So shall *Minerva* crown their glorious toil,  
And raise an *Athens* in her fav'rite Isle.

BENJAMIN WEST.

*Weedon-Beck in Northamptonshire,  
January 15th, 1773.*

---

LETTERS OF RECOMMENDATION.

*To Mr. THOMAS SADLER, on his New System  
of PRACTICAL ARITHMETIC.*

S I R,

UPON a perusal of your *Arithmetic*, I think  
it incumbent on me, (as a well-wisher to the  
literary world) to recommend it in the most express  
terms,

*Letters of Recommendation.*

**XV.**

terms, as the most useful, ingenious (considering the versification) and elegant performance I have met with, not only for initiating youth into *Arithmetic* (as the Questions are many of 'em wrought at length) but useful also for several Schoolmasters, who having had no liberal education, are often deficient in the true methods of Solution. To all such I recommend it sincerely, and hope it will be found a very useful and valuable Manual; — and that you may have all the encouragement due to such a performance, is the hearty desire of

Your humble Servant and Well-Wisher;

P. ANTROBUS.

*In Authoris laudem, et opera ejus.*

YOUR Book needs not require a greater fame,  
Than bear the title of T. SADLER's name;  
Let *Zoilus* alone, his envy's far below  
That art you here unto the world do shew:  
The pious *Watts* with all his sacred lays,  
Was he now living cou'dn't augment your praise,  
So fam'd your works; friend SADLER may you still,  
Go on to write, as you've begun with skill:  
And may your future arts resound in praise  
More noble, and sublime than bards can raise.

*Corripe lora manu, nec sit mutabile pectus  
In te, consiliis utere tuque tuis,  
Macte tua sic Arte brevi facis iter ad Figuras  
Arithmeticæ pandis commodius que vias;  
Tu elementa prima; Tu tota opera quoque  
Numerandi doces, perge, et amice vale.*

P. ANTROBUS.

*Dabem de Schola Middlewich,  
in Provincia cestrensi pridie  
Nonas Januarii, anno post  
Natum Christum; 1773.*

*To Mr. THOMAS SADLER on his New Treatise  
of ARITHMETIC.*

**SADLER!** thy genius makes the world admire,  
 And wonder how such art thou didst acquire  
 To write so well, digest thy rules so clear,  
*Herculean* labour, to compleat what's here  
 With so much truth, laid down conspicuously,  
 For th' use of man ! so graceful to the eye. —  
 But well I know, that an industrious mind  
 Makes hard things easy, to instruct mankind.  
 Thanks, thanks, my friend, are for thy labours due,  
 Candour says so, and Fame reports it true,  
 Thou hast prescribed here, a noble plan,  
 To charm the youth, t'invite th' unlearned man,  
 To taste of *'RITHMETIC's* most useful store,  
 Worth more intrinsic, than all *India's* ore.  
 With pen and ink, *it's* value none can write,  
 Nor can the thought of man the same indite,  
 Great places, and preferments are attain'd,  
 By those who in *it's* art, have knowledge gain'd.  
 Hail sprightly youths ! these pages learn with speed,  
 And richer ornaments will soon succeed.  
 Ye soft, engaging, lovely fair ! attend,  
 Here's pleasure with instruction nicely penn'd.  
*ARITHMETIC in verse*, here, here alone we view,  
 Compil'd with ornament, quite modell'd new.  
 In ev'ry page, throughout this work we find,  
 Fit, curious questions, to improve the mind  
 Of youth, and age, whose early days' pass'd by,  
 Unmindful of *this* useful, rich supply,  
 Without *whose* aid, the Merchant must resign,  
 All trade at home, and to each distant Clime ;  
 The meaner Tradesman readily will own,  
 His bus'ness without *it*, cou'd not go on.  
 By this it's plain th' **ALMIGHTY** has consign'd,  
 The art of **NUMBERS** to improve mankind,

In trade, and commerce, which on golden wings,  
Bear wealth immense t' adorn the Throne of Kings.  
Then let not envy's baneful tongue pretend,  
To blast this Work, with *good intention* penn'd:  
Nor let the *Critic* with ungen'rous mind  
Despise the whole, if he by chance shou'd find  
A few small errors, but to mind recall, —  
We err by custom, since old *Adam's* fall.  
May'st thou my friend, meet merit's just reward  
For such great labour, penn'd with due regard,  
T' instruct the age in *NUMBERS* and prepare  
The youth for business with the strictest care,  
Oh! may'st thou be rewarded for thy pains,  
And wear the *Laurel* that true merit gains.

JOHN HOPLEY.

*Occlestone near Middlewich,  
February 1st, 1773.*

To Mr. THOMAS SADLER on his *New System*  
of PRACTICAL ARITHMETIC.

S I R,

YOUR Treatise of *Aritbmetic* is truly a very excellent performance, and I have, and shall recommend it as the most ingenious piece extant, in our language, upon the subject, and heartily wish you all the encouragement due to so meritorious an undertaking, and am Sir,

Your very humble Servant,

NATH. BROWNELL.

*Coventry Mathematical  
School, Feb. 4th, 1773.*

To Mr. THOMAS SADLER, on his *New*  
ARITHMETICAL SYSTEM.

S I R,

I Greatly approve of your *Arithmetical System*, and if my recommendation of it should be thought of any service to you, it will afford me infinite pleasure to declare my sentiments to the world, of a work that in my opinion, justly entitles you to the thanks and applauses of all persons engaged in the instruction of youth; in so useful and necessary a branch of learning. I am Sir, wishing you success,

Your humble Servant,

BENJAMIN WEST.

*Weedon-Beck, in Northamptonshire,*

*February 5th, 1773.*

To Mr. THOMAS SADLER, on his *New and Ingenious Treatise of* PRACTICAL ARITHMETIC.

S I R,

YOUR last I receiv'd, together with the sheets of your *Arithmetic*, I exceedingly like your plan of proceeding, as 'tis not only useful, but even very entertaining both to youth and those of riper years. The whole of your work is handled in a masterly manner, which doubt not will render it a favourable reception to the public; for my part, shall introduce it to my pupils as the best of the kind extant, and am, (wishing your success in all your undertakings)

Sir, Your sincere Friend,

and humble Servant,

WILLIAM GOUGH.

## NOTATION OF NUMBERS.

**N** OTATION teacheth to express  
 Numbers in value, more or less;  
 Ten Characters will form complete,  
 What sums you want tho' e'er so great.

## NUMERATION TABLE.

										1 Unit.
									2 1	Tens.
								3 2 1		Hundreds.
							4 3 2 1			Thousands.
						5 4 3 2 1				T. of Thousands.
					6 5 4 3 2 1					C. of Thousands.
				7 6 5 4 3 2 1						Millions.
			8 7 6 5 4 3 2 1							T. of Millions.
		9 8 7 6 5 4 3 2 1								C. of Millions.

**I**N this Table each Figure from the place of Units, increaseth in a tenfold proportion; as 1 in the first place is unit or one; 2 in the second place, is two Tens or Twenty; 3 in the third place is three Hundred and so of the rest.

A

When

When large Numbers are expressed by Figures, for the more easy reading of them; let them be divided from the right-hand towards the left into Periods, and half Periods, each Period to contain six Characters or Figures, then the first Period will be Units or Ones, the second Millions, third Billions, fourth Trillions, fifth Quadrillions, and sixth Quintillions, as below.

*Note*, the first half of any Period, are so many Units, the latter half so many Thousands of

Quintillions.	Quadrillions.	Trillions.
<i>th. un.</i>	<i>th. un.</i>	<i>th. un.</i>
123, 456.	123, 456.	123, 456.
Billions.	Millions.	Units.

Addition

# A D D I T I O N.

**A** D D I T I O N teacheth us to find  
 The truth of Numbers when combin'd;  
 The Sum or Total to express  
 Of any Numbers, great or less.

First of Simple Numbers.

## R U L E.

As Numeration does direct  
 To place your Numbers, don't neglect;  
 First to the right begin to count,  
 And you will find with ease th' amount.  
 Then underneath write down th' excess  
 Above what Tens it shall express;  
 Which Tens add up with the next row  
 And through the whole you thus must go.  
 Let these Numbers be added together.

**EXAMPLE 1.      EXAMPLE 2.      EXAMPLE 3.**

To

To add up the Sum of EXAMPLE 1. Begin and say 4 and 2 are 6 and 9 is 15, then make a dot with the pen, and carry the overplus or excess to the next Figure, and say 5 and 3 are 8 and 1 is 9 and 3 is 12, make a dot, and write the excess above 10 in the place of Units, under the first line, and carry the two dots or tens to the second row, and say 2 and 1 are 3 and 5 is 8, and 8 is 16 make a dot for the ten, and say 6 and 4 are 10, make a dot, and say 4 and 7 are 11, write down the overplus 1 under the second line or row, and carry the three dots or tens to the third row and say 3 and 7 are 10 make a dot, then 5 and 4 make 9, which write under the third row, carrying 1 dot, or 10 to 6 makes 7 and 1 is 8, which write down under the fourth row, then the whole sum of the Numbers given in Example 1 makes 8912; in words, eight Thousand nine Hundred and twelve.

Some Arithmeticians who have made a little progress in Numbers, perhaps may object to the above method of pricking off the tens &c. and explode it, but Mr. EMERSON and the most celebrated Authors recommend it as a very sure method for beginners, whether in Simple or Compound Numbers.

When the learner has got a little knowledge of what he is about, 'twill be found very easy to proceed in the following manner as by Example 2. Say 7 and 5 are 12, and 7 is 19 and 9 is 28 and 5 is 33 and 4 is 37. now there being 7 above 3 tens, write down the excess in the place of Units, and carry 3 to the second row saying 3 and 6 are 9. and 6 is 15 and 8 is 23 and 7 is 30 and 3 is 33 write down 3 under the second row and carry 3 to the third row, saying 3 and 4 are 7 and 5 is 12 and 4 is 16 and 1 is 17, write down 7 and carry 1 to the fourth row, then say 1 and 3 are 4, and 6 is 10 and 4 makes 14. write down the excess and carry 1 to the fifth row, saying 1 and 1 are 2 and 5 is 7 write down 7 under this row, then 6 only  
re-

remaining in the sixth row write that down in its proper place, Unit them up according to your Numeration Table, and they will be six Hundred, seventy-four Thousand, seven Hundred and thirty-seven. By either of the above methods proceed to add up the other Example, and you will have the sum as there underneath it is.

The best way to prove Addition is by beginning at the top and adding up all the Numbers downwards, the same as you did upwards; if both sums agree the Work is undoubtedly right.

## AMUSING QUESTIONS &c.

### A PARADOXICAL QUESTION.

Into my House, came neighbour *John*,  
With three legs and a wooden one;  
If one was taken from the Swain,  
Just five ye wits would then remain.

### *Solution.*

According to the Roman notation the number of legs are *IV*.  $\cong$  4. then by taking away the *I* only the *V* remaining makes 5. which answers the conditions required.

An.

Another by Mr. Samuel Hammond, in Ladies Diary for 1760.

In only *one*, I'll prove there's *none*,  
 In *seven*, *five*, no more;  
 But (without tricks) there's *nine* in *six*,  
 Altho' in *five* but *four*.  
 What I've above, propos'd to prove,  
 Is literally true,  
 And hope next year, ye artists rare,  
 'Twill be resolv'd by you.

Answer'd in the then next year's Diary, viz, 1761,  
 by T. Sadler, thus

In *One* a *Cypher* Sir I see;      *O*.  
 In *seVen*, *five* I must confess,      *V*.  
 In *sIX* there's *nine* all must agree,      *IX*.  
 In *sIVe* there's *four* nor more nor less.      *IV*.

TABLES of the most common Coins  
 Weights and Measures, used in *Great Britain*.

First of *English Money*.

Farthings. f.	Pence. d.		
4	1	Shillings. s.	
48	12	1	Pounds. l.
960	240	20	1

## S C H O L I U M.

The foregoing Table and the succeeding ones are explained in the following Manner, the words at Top express the Names of all the numbers below them, with the Character under each Word, and are to be read, or learned by Heart thus; 4 farthings equal to 1 penny. 48 farthings 12 pence or 1 shilling. 460 farthings, 240 pence, 20 shillings equal to 1 pound.  $\frac{1}{4}$  denotes 1 farthing, or 1 fourth of a penny,  $\frac{1}{2}$  denotes 2 farthings, or 1 half of a penny;  $\frac{3}{4}$  denotes 3 farthings, or 3 fourths of a penny. 4 pence is 1 groat, 6 pence 1 tester, 5 shillings 1 crown, 6 shillings and 8 pence 1 noble, 10 shillings one angel, 13 shillings and 4 pence 1 mark.

## T R O Y W E I G H T.

Grains.	Pennyweights.		
gr.	dw.		
24	1	Ounces.	
		oz.	
480	20	1	Pound.
			lb.
5760	240	12	1

The celebrated Mr. *Malcolm*, in his laborious System of Arithmetic page 74, says “ That the Original of all Weights in *England* was a Corn of Wheat, taken out of the middle of the Ear and well dried; of which 32 made one Penny Weight, instead of which, they made afterwards another Division of the Pennyweight into 24 Grains.”  
Mr.

Mr. *Ward* (in his *Young Mathematicians Guide*) cites a Statute of *Edward III.* by which there ought to be no Weight used but Troy, “but Custom” (says he) “afterwards prevailed in giving larger Weight to coarse and Droffy Commodities, and thereby introduced the Weight called *Averdupoise*,” and as to the proportion betwixt Troy and *Averdupoise* Weight, he says, “that by a very nice Experiment he found that one pound *Averdupoise*, is equal to 14 Ounces 11 Penny Weights 15  $\frac{1}{2}$  Grains Troy” So that neither the Ounce nor Pound are the same.

By *Troy Weight* are weighed Jewels, Gold, Silver, Corn, Bread and Liquors.

## APOTHECARIES WEIGHT.

Grains. gr.	Scruples. scr.			
20	1	Drams. dr.		
60	3	1	Ounces. oz.	
480	24	8	1	Pounds. lb.
5760	288	96	12	1

*Apothecaries* is the same as *Troy Weight*, and is so called because the *Apothecaries Druggists* &c. compound their Medicines by it, but they buy and sell their Drugs by *Averdupoise Weight*.

AV ER-

---

# AVERDUPPOISE WEIGHT.

---

Grocery and chandlers wares, and all metals, except *gold* and *silver*, are weighed by this weight, according to Mr. *Malcolm*, sheeps wool weight has these denominations, 7 pounds = 1 clove, 2 cloves = 1 stone = 14 pounds, (but in *Scotland* and many places in *England*, 16 pounds are reckoned to the stone,) 2 stones = 1 tod,  $6\frac{1}{2}$  tods = 1 wey, 2 weys = 1 sack; 12 sacks = 1 last.

<hr/>		

To add up Example 1. Begin and say 3 and 1 is \* 4, make a dot and carry 1 to the next denomination, saying, 1 and 8 is 9 and 11 is 20, make a dot and carry the overplus above 12, to wit 8, to the next figure, saying, 8 and 4 is 12, make a dot and say, 9 and 4 is 13, which is 1 above 12, therefore make a dot and write down 1, and carry the three pricks or dots to the next denomination, and say, 3 and 15 is 18, and 10 is 28, make a dot and carry the excess above 20, to wit, 8 to the next figure, saying 8 and 16 is 24, make a dot, then say 4 and 10 is 14, and 16 is 30, make a dot, and write down the excess 10 under its own line, and carry 3 (the number of dots) to the place of pounds, and say, 3 and 8 is 11, make a dot, and say, 1 and 9 is 10, make a dot, then 1 and 2 is 3 and 1 is 4, which write under its own line, and carry the 10 or dots to the next row. Saying, 2 and 1 is 3 and 4 is 7 and 1 is 8, write down 8 at the bottom of the line, then 3 remains in the

¶ C third

\* See the marginal notes in Multiplication.

third row, which write down in the third place, and the sum total is, three hundred and eighty four pounds, ten shillings and one penny.

The above method being so easy to be understood, I shall now proceed to shew the learner how to add up such sums by a more expeditious method, and for that purpose, take Example 2. and say, 1 and 3 is 4, and 2 is 6 and 1 is 7 and 3 make 10; 10 farthings is two pence halfpenny, set down the halfpenny thus  $\frac{1}{2}$  and carry the two pence to the pence row, saying, 2 and 3 is 5, and 7 is 12 and 4 is 16 and 11 is 27 and 5 is 32, then say, 30 pence is 2 shillings and 6 pence, and 2 pence is 2 shillings and 8 pence, set down 8 and carry 2; and proceed to the shillings and say, 2 and 2 is 4, and 7 is 11, and 9 is 20 and 8 is 28 and 4 is 32 (which is 2 above 3 tens) set down the 2 and go on to the next row (which is composed of a number of *ones* being so many *ten shillings*, as you may see by their being placed or set in the *place of tens*) and (therefore) carry the 3 tens thereto, and say, 3 and 1 is 4 and 1 is 5 and 1 is 6 and 1 is 7 and 1 is 8, eight ten shillings make 4 pounds, which carry to the place of pounds, and say, 4 and 2 is 6 and 7 is 13 and 1 is 14 and 6 is 20 and 1 is 21, write down 1, and carry 2 saying, 2 and 1 is 3 and 6 is 9, and 5 is 14, and 8 is 22 and 4 is 26, which write down and the total will be two hundred and sixty one pounds, two shillings and eight pence halfpenny, in the same manner proceed with the following examples, or any other of the like kind or fort.

Answer		£.4	5	4 $\frac{1}{4}$
<hr/>				

## EXAMPLE 9.

Old *SIMON* aged ninety two,  
 At last did bid this world adieu,  
 Some mouldy pelf he left behind,  
 Which oft disturb'd his craving mind.  
 Four sons he had, and each now claims  
 His share, *John*, *Simon*, *Ralph*, and *James*;  
 His wife b'ing dead, he'd daughters three,  
 Call'd *Susan*, *Ruth*, and *Margery*.  
 His will b'ing read, young *Simon* found,  
 He must receive three hundred pound,  
 Just eight score pounds too was *Ralph's* part,  
 But *John* he bore an aching heart,  
 And of his fortune was beguif'd,  
 Because he'd got their maid with child.

One

# Compound Addition.

29

One shilling only was his share,  
 But James it seems had better fare,  
 Of cash in pounds six score had he,  
 And Susan's part was ninety three;  
 But Ruth unlucky girl had ran  
 Away with Joe the servant man,  
 And for the hasty crime she'd done;  
 Was cut off just the same as John;  
 But Marg'ry's share amongst the rest,  
 By calculation prov'd the best,  
 For by the father's will we find,  
 The chest which SIMON left behind  
 Had store of pelf,—the treasure found,  
 Amounted to four hundred pound:  
 Of clothes and goods it did appear,  
 Just thirty pound was made out clear,  
 All this was left to Madge because,  
 She had obey'd her father's laws.  
 Now Tyro you with ease may find,  
 The fortune SIMON left behind.

To answer this Example, is no more than to write down each one's fortune as under, and add them together.

		£.	s.	d.
Simon's	} share	300	—	—
Ralph's		160	—	—
John's		—	1	—
James's		120	—	—
Susan's		93	—	—
Ruth's		—	1	—
Marg'ry's		430	—	—

Sum left £.1103 2 —

## EXAMPLE 10.

A house keeper had disburs'd for her lady, in marketing, (per memorandum book,) for *beef*, ten shillings and five pence halfpenny, *mutton*, seven shillings and eight pence, *veal*, five shillings and three pence farthing, *chickens*, nine groats, and for *eggs*, seven farthings. What was the sum disburs'd?

			s.	d.
<i>Beef</i>	-	-	10	5 $\frac{1}{2}$

## EXAMPLE 11.

*Frank Guzzle, Belch, and Soaking Dan,*  
 Must have a bottle with Sir John, \*  
 And toppers like with Trot † prevail,  
 To fill a jug of nappy ale.  
 A jug! a mighty jug indeed,  
 A yard about was fill'd with speed;  
 Ten quarts it held, as neighbours tell,  
 Which pleas'd the Landlord mighty well.  
 Three times b'ing fill'd the toppers they,  
 Cou'd scarce conduct themselves away,  
 But paid the score which pleased Trot,  
 To think what customers he'd got,  
 'Twas fifty pence a piece the shot,  
 What was the whole young Tyro tell;  
 Which pleas'd the Landlord Trot so well?

\* Sir John Barleycorn      † The Landlord.

TROY

**TROY WEIGHT.**

A *Lady* of fortune being desirous of furnishing herself with household plate, went to a Silver-smith and bought *dishes* to the weight of 20 lb. 10 oz. 18 dwt. and 21 grs. *plates* 37 lb. 19 dwt. and 14 gr. *spoons* 8 lb. 9 oz. and 4 dwt. *salts* 3 lb. 15 dwt. and 19 gr. a *tankard* and *cup* 5 lb. 11 oz. and 14 dwt. and also three *waiters* 12 lb. and 23 gr. What weight of plate did she buy in all?

**Write down the weight of each quantity under each other, and add them up as in addition of Money, only take care to point or dot, according to the table pertaining to this weight in page 14 and as you see express'd at the top of each denomination in this example.**

		(12)	(20)	(24)
		lb.	oz.	dwt. gr.
Dishes	-	20	10	18 21.
Plates	-	37	-	19 14.
Spoons	-	8	9	4 -
Salts	-	3	-	15 19.
Tankard &c.		5	11	14 -
Waiters	-	12	-	- 23
		87	9	13 5

*Note, you may work this example and all others of the kind without dotting, (except at the grains) for the penny weights are to be work'd the same as shillings, the ounces as pence, and the pounds as integers.*

## Compound Addition.

35

### APOTHECARIES WEIGHT.

An *Apothecary* made a composition of 6 ingredients, the weight of the 1st. was 12 lb. 6 oz. 4 dr. 1 scr. and 13 gr. the 2d. 8 lb. 4 oz. 5 dr. 2 scr. and 14 gr. the 3d. 9 lb. 1 scr. and 16 gr. the 4th. 14 lb. 3 oz. and 1 dr. the 5th. 6 lb. 11 oz. 4 dr. 2 scr. and 17 gr. and the 6th. 11 lb. 2 scr. 5 gr. What was the weight of the whole?

No.	lb.	(12) oz.	(8) dr.	(3) scr.	(20) gr.
1	12	6	4.	1	13

6	11	-	-	2.	5
<hr/>					
Ans.	62	2	1	2	5

*Note, the grains are cast up as shillings, and the ounces as pence.*

### AVERDUPOIZE WEIGHT.

A Country shopkeeper bought of a Tradesman in London, *Sugars* weighing 4 c. 3 qrs. and 9 lb. *Raisins* 2 c. 1 qr. and 21 lb. *Teas* 1 c. and 3 qrs. *Coffee* 3 qr. and 19 lb. and *Spices* 1 c. and 12 lb. What was the whole weight?

		(4) c.	(28) qr.	lb.
Sugars	-	4	3	9.
Raisins	-	2	1	21
Teas	-	1	3	-
Coffee	-	-	3	19.
Spices	-	1	-	12
<hr/>				
Answer	11	-		5

*N. B.* No occasion for dotting at the *quarters*, they being cast up as tho' they were farthings.

A Stocking Weaver bought 6 bales of silk containing, (*viz.*)

N <sup>o</sup> .	lb.	(16) oz.	(16) dr.
1	5	10.	12.
2	2	8	14.
3	3	4	15.
4	6	14.	12.
5	5	15.	8
6	1	2	3

Answer 25    9    -

### LONG MEASURE.

A Turnpike Surveyor measures upon the road, from *A* to *B* 6 miles, 4 furlongs 15 poles, from *B* to *C* 4 miles, 7 furlongs, 30 poles, from *C* to *D* 10 miles, 20 poles, from *D* to *E* 9 miles, 6 furlongs, 12 poles, and from *E* to *F* 12 miles 2 furlongs 15 poles. What is the distance betwixt *A* and *F*?

		(8) m.	(40) fur.	pls.
From <i>A</i>	} to {	<i>B</i>	6	4 15.
<i>B</i>		<i>C</i>	4	7. 30
<i>C</i>		<i>D</i>	10	- 20.
<i>D</i>		<i>E</i>	9	6. 12
<i>E</i>		<i>F</i>	12	2 15
Answer		<u>43</u>	<u>5</u>	<u>12</u>

*Note*, there is no need to dot when adding up *poles*, for they are only as tho' they were two rows of figures the first *integers*, and the second *farthings*, but that I may not leave the learner under the least difficulty

(of which I shall always be as careful as possible) let me further explain my meaning, by shewing how to add

## Compound Addition.

37

The distance from 4 statues, *A B C D* being measured along a walk to an obelisk in a nobleman's garden, was found to be as follows to wit, from *A* to *B* 140 yards, 2 feet, 11 inches. *B* to *C* 134 yards, 1 foot, 9 inches. *C* to *D* 151 yards, 4 inches. and from *D* to the obelisk 108 yards, 2 feet, 8 inches. What was the whole distance ?

			(3)	(12)				
			yds.	ft.	inch.			
From	{	<i>A</i>	to {	<i>B</i>	140	2.	11	Note, <i>inches</i> are cast up in the same manner as <i>pence</i> .
		<i>B</i>		<i>C</i>	134	1	9	
		<i>C</i>		<i>D</i>	151	—	4	
		<i>D</i>		ob. 108	2.	8		
Answer			535 1 8					

---

add up the *poles* in this example, to do which, say 5 and 2 is 7 and 5 is 12, set down 2 and carry 1, and say, 1 and 1 is 2 and 1 is 3 and 2 is 5 and 3 is 8 and 1 is 9; 9 *quarter poles* is 2 *furlongs* and 1 *quarter*, the same as 9 *farthings* is 2 *pence* farthing, therefore set down 1, and the sum is 2 *furlongs* and 12 *poles*, the same as if you had dotted, then carry the 2 *furlongs* to the row of *furlongs*, and proceed to work the question.

D

CLOTH

## CLOTH MEASURE.

A draper at a Fair bought 5 pieces of cloth, each piece containing as follows, viz.

N <sup>o</sup> .		yds.	(4)	(4)
			qr.	nl.
1	—	35	3	3
2	—	46	1	2
3	—	21	3	1
4	—	47	1	3
5	—	19	2	1

The learner may observe that *nails* and *quarters* are cast up the same as *farthings*.

Answer 171 - 2

## LAND MEASURE.

A farmer rents 4 pieces of land containing.

		(4)	(40)
		ac.	ro. pls.
In one field	16	1	24
In another	24	3	14
In another	21	1	12
In another	13	1	34
<u>Answer</u>	<u>75</u>	<u>3</u>	<u>34</u>

To cast up *poles* without dotting you have directions in the preceding page, and the *roods* are added up as though they were *farthings*.

WINE

## WINE MEASURE.

A nobleman bought of a wine merchant, the following sorts and quantities of wine viz. port 1 tun 1 hoghead and 36 gallons, claret 2 hogheads 49 gallons, mountain 2 hogheads 30 gallons and 4 pints, and lisbon 3 hogheads 7 pints. How much did he buy in all?

	(4)	(63)	(8)	
	tu.	hhd.	gal.	pts.
Port	1	1	36	—
Claret	—	2	49.	—
Mountain	—	2	30	4.
Lisbon	—	3	—	7
Answer	3	1	53	3

Hogheads are cast up the same as farthings.

## ALE and BEER MEASURE.

A London brewer sent into the country, ale and beer as follows, viz. at one time 4 hogheads 19 gallons, at another 3 hogheads 15 gallons, at another 12 hogheads 24 gallons, at another 5 hogheads 19 gallons, and at another 8 hogheads 5 gallons. How much was sent out in all?

		(51)	
		hhds.	gal.
Delivered the	{ 1st. }	{ time }	{
	2d.		
	3d.		
	4th.		
	5th.		
		4	19
		3	15.
		12	24
		5	19
		8	5
Answer		33	31

## DRY MEASURE.

A cornfactor delivers out of his granary the following quantities of corn, *to wit*, wheat 7 quarters 1 comb 3 bushels and 2 pecks, rye 5 quarters 1 comb 2 bushels and 1 peck, oats 4 quarters 1 bushel and 3 pecks, and barley 3 quarters 1 comb and 3 bushels. What was deliver'd in all?

	(2)	(4)	(4)	
	qr.	com.	bu.	pk.
Wheat	7	1	3	2
Rye	5	1	2	1
Oats	4	—	1	3
Barley	3	1	3	—
Answer	21	1	2	2

The pecks and bushels are cast up like farthings, and the combs like halfpence.

## T I M E.

A certain person had 4 sons, *Ralph, John, James, and Andrew*, when *John* was born, *Ralph's* age was 2 years 4 months 1 week and 3 days, when *James* was born, *John's* was 3 years 5 months 3 weeks and 4 days, and when *Andrew* was born *James's* age was 4 years 9 months 1 week and 5 days. How old was *Ralph* (the eldest son) when *Andrew* (the youngest) was born?

was born?	(12)(4)(7)												
	y.m.w.d.												
<i>Ralph's</i> } <i>John's</i> } age when { <i>James's</i> }	<i>John</i> <i>James</i> <i>Andrew</i>												
was born	<table> <tr><td>2</td><td>4</td><td>1</td><td>3</td></tr> <tr><td>3</td><td>5</td><td>3</td><td>4</td></tr> <tr><td>4</td><td>9</td><td>1</td><td>5</td></tr> </table>	2	4	1	3	3	5	3	4	4	9	1	5
2	4	1	3										
3	5	3	4										
4	9	1	5										
Answer	10 7 2 5												

Here you see that *weeks* are to be added up in the same manner as *farthings*, and *months* in the same manner as *pence*.

PRO-

## PROMISCUOUS QUESTIONS,

Selected from the best authors, for the exercise of the learner, with the *name* of the *author* prefixed to his performance.

Question 1. From Mr. *Vyfe's* Arithmetic, page 30.

A person said he had 20 children, and that it hap-  
pen'd there was a year and a half between each of  
their ages, his eldest was born when he was 24 years  
old, and the age of the youngest is now 21. What  
was the father's age?

	years
Father's age when the eldest child was born	24
19 Children allowing 1 year $\frac{1}{2}$ between each	28 $\frac{1}{2}$
The age of the youngest child	21
	<hr/>
The age of the father	73 $\frac{1}{2}$
	<hr/>

Question 2. By the celebrated Mr. *Emerson*; \* see his  
Arithmetic page 189.

Three companies of soldiers passing by a shepherd  
the first takes half his flock and half a sheep, the se-

*Note*, when the learner is thoroughly acquainted  
with the rule of *Reduction*, it will then plainly appear  
to him, that there will be no need to point or dot in  
casting up any sum in addition of what kind soever,  
and which will be far preferable than dotting, as  
no dots or blots ought to be made (if possible to be  
avoided) amongst writing or figures.

\* Mr. *Emerson* solves this question by double posi-  
tion.

cond takes half the remainder and half a sheep, the third takes half the last remainder and half a sheep, after which the shepherd had 20 remaining. How many had he at first? It is evident by the question the shepherd had taken from him at the 3 different times 21, 42, and 84, to which add 20 remaining the sum will be 167 the answer required.

*A Paradoxical Question* extracted from the *Royal Magazine*.

A gentleman dying left his executor a sum not amounting to 2000l. to be so divided amongst his relations, that his *father* and *mother* his *son* and his *grandson*, his *brother* and his *daughter*, should each receive a sum not less than 666l. 13s. 3d. *Quere* the scheme of kindred and exact sum left?

S O L U T I O N .

Suppose two widows *A* and *B* no kin to each other, to be left each with a son, and that *A's* son marries *B*, and *B's* son marries *A*, and that *A's* son has a son by *B*, this is the scheme of kindred. *Note*, *A's* son is the gentleman that leaves the money, and for finding the exact sum left, proceed thus

	<i>£.</i>	<i>s.</i>	<i>d.</i>
To his <i>father</i> who in this case is the same as his <i>son</i> .	666	13	3

Sum left 1999 19 9

---

The

The learner now being supposed to be sufficiently taught to add up any sum of pounds, shillings, pence, &c. 'twill be necessary and much to his or her advantage, to get by heart the following forms of *acquittances, promissory notes* &c. and to transcribe them into his or her accompt book, in order to prepare themselves for real business. As to forms of bills of parcels &c. they will be found inserted after the rule of *practice*.

Acquittances upon Receipt of Money.

August 4th, 1772.

Received of Mr. *Anthony Champion* the sum of ten pounds fourteen shillings and nine pence in full of all demands

per *Timothy Sly*.

£ 10 14 9

Received 12th, *August* 1772 of Mr. *Isaac Pedley* forty pounds on account.

per *Matthew Prior*.

£ 40

Reced *May* 2d, 1772 of Mr. *Patrick M<sup>r</sup> Quinsey*, eighteen pounds and eighteen shillings, being his year's rent for 1771, for late *Bentley's* house &c. due *Lady Day* last (1772)

To me *William Peers*.

Reced 10th, *April* 1772 of Mr. *Silas Hopley*, fifteen pounds and fifteen shillings on account of goods sold him

By me *Andrew Marvell*.

*Ralph*

*Ralph Stanley Esq.* To *James Jones Esq. Dr.*  
To taxes paid for the Woodland Tenement in B—  
for the year 1771, as under

	£.	s.	d.	
Land tax at 4s. per pound	2	15	0	
	£.	s.	d.	
1st poors ley	0	13	9	} 1 10 11 $\frac{1}{2}$
2d. do.	0	10	3 $\frac{1}{4}$	
3d. do	0	6	10 $\frac{1}{4}$	
Highway do. (not any)				
Constables do.	0	6	10 $\frac{1}{4}$	
Church do.	0	3	5 $\frac{1}{4}$	
	—————			£. 4 16 3

Reced *April 14th, 1772* of *Ralph Stanley Esq.*  
(by the hands and payment of his agent *Mr. Peter Proud*) the contents of this bill for the use of *James Jones Esq.* by me *John Tuxley;*

Reced *April 14th, 1772* of Captain  
*James Jones* (by the hands and pay-  
ment of his agent *Mr. John Tuxley*)

In cash	£ 22 13 9	
per bill of taxes paid for	£. 4 16 3	£. s. d.
the year 1771*		27 10 0

in the whole twenty seven pounds and  
ten shillings, being his last half year's  
rent for 1771, for the Woodland Tene-  
ment in B— due *Lady Day* last (1772)  
to *Ralph Stanley Esq.* for whose use  
the same is received

by me *Peter Proud.*

Reced 19th, April 1772 of Mr.	
<i>Ralph Jameson</i> (per son <i>George</i> ) forty	£. s. d.
pounds being his first half year's rent	40 0 0
for 1768, for late <i>Jameson's</i> tenement	
due to <i>Ralph Stanley Esq.</i> at <i>Michael-</i>	
<i>mas</i> 1768,	

per *Peter Proud.*

\* See the bill of taxes above.

Reced.

*Acquittances, &c.*

45

Reced. *April 20th, 1772* of *Mr. Simon Tradewell*, nineteen pounds and ten shillings, in full for my master *Peter Dealer*,

By me *Robert Jacobs.*

---

£19 10 0

---

Rece'd *April 24th, 1772* of the Right Reverend *Abiathar Lord Bishop of C* — by the hands of *Mr. Francis Harding*, the sum of one hundred and fifty pounds, in full for three quarterly payments of my annuity, due *Lady Day* last past (1772)

---

£.150

---

To me *Jamima Lovely.*

*February 16th, 1772* reckoned and balanced all accounts, and I *Simon Rowley* do acknowledge my self to be indebted to *Beardmore Duckenfield*, five pounds four shillings, which I promise to pay to him or his order on demand, for value received as witness my hand,

Witness

*Simon Rowley.*

*Jacob Manlove.*

Sir £5 4 0 *Whitchurch February 18th, 1772*

Please to pay to *Mr. Beardmore Duckenfield* or order, five pounds four shillings and place it to the account of

Your humble Servant

*Simon Rowley.*

To *Mr. Aaron Hill* Grocer at the three Sugar Loaves *Fleet-street London.*

*London June 6th, 1772*

I promise to pay the Honourable *Congreve Ellis* Esq. or bearer, on demand, sixty pounds.

For Sir *James Rich* and partners.

*Thomas Trueman*

---

£60

---

I promise

I promise to pay to Mr. *Luke Spiggot* or bearer on demand, forty pounds, *January 19th, 1772.*

per *James Jones.*

£40

I promise to pay to *Robert Heath Esq.* or order on demand, sixty-three pounds and ten shillings, value received this 24th-day *March 1772.*

by me *Thomas Holland.*

£63 10

I promise to pay to *Sir Solomon Lowe* or order, the sum of forty pounds in manner following, that is to say, twenty pounds, part thereof two months after date, ten pounds another part thereof, on the 16th, day of *December* next, and the remaining ten pounds on the 30th of *March* next (1773.) for value of him received as witness my hand at *Chester* the 15th day of *June 1772.*

*Nathaniel Fisher.*

£40

Signed in the presence of

*Simon Testis*

*Reuben Jones*

## SUBTRACTION.

**S**UBTRACTION is a useful art,  
 Whene'er you pay a sum in part  
 To find the diff'rence left behind,  
 As by the rule below subjoin'd.

*Of*

Of Simple SUBTRACTION.

R U L E.

From ev'ry greater sum subtract  
 The lesser and to be exact,  
 Begin to work with units row,  
 And write the difference down below;  
 And when the upper figure's less  
 Than what that under shall express,  
 Add ten,—subtract,—and carry one  
 To the next figure—thus go on.

To prove subtraction is no more than adding the difference to the next line above it, and if the sum be the same as the top-line, then the operation is right.

EXAMPLE 1.

From 94165  
 Take 35641  
 -----  
 Rem. 58524  
 -----  
 Proof 94165  
 -----

EXAMPLE 2.

From 861416  
 Take 596789  
 -----  
 Rem. 264627  
 -----  
 Proof 861416  
 -----

EXAMPLE 3.

From 431678  
 Take 390169  
 -----  
 Rem. 41509  
 -----  
 Proof 431678  
 -----

EXAMPLE 4.

From 900000  
 Take 345678  
 -----  
 Rem. 554322  
 -----  
 Proof 900000  
 -----

To

To work example 1st, say 1 from 5 and there remains 4, write down the difference 4 in the place of units, and say, 4 from 6 and there remains 2, which write down in the place of tens. Then say 6 from 1 I cannot, but 10 that I borrow to 1 is 11, 6 from 11 and there remains 5, then 1 that I borrowed and 5 is 6, 6 from 4 I cannot, but 6 from 14 and there remains 8, 1 that I borrowed and 3 is 4, 4 from 9 and there remains 5. Then to prove if the work be right, say 4 and 1 is 5, 2 and 4 is 6, 5 and 6 is 11, set down 1 and carry 1 to 8 is 9, and 5 is 14, set down 4 and carry 1 and say 1 and 5 is 6, and 3 is 9, which set down, and you will see that this line corresponds with the uppermost, and proves the work to be right.

## EXAMPLE 2.

To work this example you must say, 9 from 6 I cannot, but 9 from 16, and there remains 7, 1 that I borrowed to 8 is 9, 9 from 1 I cannot, but 9 from 11 and there remains 2, 1 that I borrow'd, to 7 is 8, 8 from 4 I cannot, but 8 from 14 and there remains 6, 1 that I borrow'd, to 6 is 7, 7 from 1 I cannot, but 7 from 11 and there remains 4, 1 that I borrow'd to 9 is 10, 10 from 6 I cannot, but 10 from 16 and there remains 6, 1 that I borrow'd to 5 is 6, 6 from 8 and there remains 2, which set down and the work is done, but as these things are so easy, I think that any further explanation of the rest wou'd be look'd upon as prolixity only.

## S C H O L I U M.

*Subtraction* is just the reverse of *Addition*, for instead of adding a given number, to a given number; we take a lesser given number from a greater. Many authors call the greater number the *Subtrahend*, and the lesser the *Minuend*, and the one taken from the other is the *difference*.

EXAM-

EXAMPLE 5.

*Roger Bacon* a learned *English Monk*, of the *Franciscan* order, was born near *Ilchester* in *Somersetshire*, in the year 1214. How many years is that since?

From 1772

Take 1214

Answer 558 years.

EXAMPLE 6.

The age of a lady is twenty and three,  
What year was she born in, pray tell unto me?

From 1772

Take 23

Answer 1749

EXAMPLE 7.

*Rene des Cartes* a most eminent *French* philosopher and mathematician was born in 1596, and died in 1650. How old was he at the time of his death?

From 1650

Take 1596

Answer 54 years.

E

I  
Solon

## Subtraction.

## EXAMPLE 8.

*Solon* died 549 years before CHRIST was born,  
How many years was that after the creation of the world?

First,  $549 + 1772 = 2321$  the number of years since he died,

Then from 5779 } the number of { the creation.  
Take 2321 } years since { *Solon* died.

Answer 3458

## EXAMPLE 9.

*Ovid* a celebrated poet, and Roman knight, was born in the year of the world 3964. How many years is that since?

From 5779  
Take 3964

Answer 1815 years.

## EXAMPLE 10.

Since *Sisyphus* reigned, it plainly appears,  
Is two thousand sev'n hundred, forty nine years,  
Since *Sesac* was living who *Japetus* flew,  
Is two thousand seven hundred *plus* twenty two.  
Since *Hesiod* flourish'd, chronology'll fix,  
Two thousand six hundred and thirty *plus* six.  
Since *Tiglath-pileser* succeeded king *Pul*,  
Is two thousand, five hundred thirteen years full.  
Since *Nabopolassar*, old *Babylon* won,  
Is two thousand three hundred ninety *plus* one.  
Betwixt each event the interval of time,  
I'd have you make known e'er mount science you climb.

Note

# Subtraction.

51

Note this question I propos'd in the year 1766.  
 —To answer which first,

From 2749  
 Take 2722

Ans. 27 years from *Sisyphus* to *Sesac*.

2d. From 2722  
 Take 2636

Answer 86 years from *Sesac* to *Hesiod*.

3d. From 2636  
 Take 2513

Answer 123 years from *Hesiod* to *Tiglath-pileser*.

4th. From 2513  
 Take 2391

Answer 122 years from *Tiglath-pileser* to *Nabopolassar*.

## EXAMPLE II.

The height of the *Monument* at *London* is 202 feet, which is 24 feet higher than the *Trajan's Pillar* at *Rome*, I demand the height of the pillar?

From 202  
 Take 24

Answer 178 feet.

## EXAMPLE 12.

Two maypoles length, thirty-six yards not more,  
 Diff'rence in inches, fourteen tens *plus* four.  
 Th' diff'rence of yards, when added to their sum,  
 Is twice the great pole, hence an answer 'll come.

## SOLUTION.

First, 144 inches are equal to 4 yards, then it is plain per question, that 36 yards (the length of the 2 poles) added to 4 (to wit, their difference in yards) = 40 which (by question) is twice the length of the greater pole, consequently 20 is the real length thereof. in yards then,

From 20 the length of the greater pole.

Take 4 the difference

Rem. 16 the length of the lesser pole.

## EXAMPLE 13.

An old worthless miser just before he expired made his will, wherein he directed that the sum of 4000 l. (to wit, the amount of his estate) shou'd be divided between his wife and 4 daughters in manner following, viz. to the *eldest daughter* 1000l. *minus* 100l. to the *second daughter* 1000l. *minus* 200l. to the *third daughter* 1000l. *minus* 300l. to the *fourth daughter* 1000l. *minus* 400l. and the remaining part to the widow. What had each one to their respective share?

L.

From 1000  
 Take 100

Ans. 900 eldest daughter's share.

From

From <sup>£.</sup> 1000  
Take 200

Rem. 800 second daughter's share.

From 1000  
Take 300

Rem. 700 third daughter's share.

From 1000  
Take 400

Rem. 600 youngest daughter's share:

Whole Estate                      <sup>£.</sup> 4000

Eldest	}	Daughter's Share	{	<sup>£.</sup> 900	3000

Remains widow's share 1000

## EXAMPLE 14.

A nobleman had in his park 1000 oak, 6000 ash, 4000 beech, 900 poplar, 1146 elm, and 180 fir trees. Out of which were fal'n, 424 oak, 2346 ash, 310 beech, 149 poplar, 146 elm, and 80 fir trees. How many trees were left standing in the said park?

N <sup>o</sup> . of Trees.		N <sup>o</sup> . of Trees fallen.	
Oak	1000	Oak	424
Ash	6000	Ash	2346
Beech	4000	Beech	310
Poplar	900	Poplar	149
Elm	1146	Elm	146
Fir	180	Fir	80

In all	<u>13226</u>	Fallen	<u>3455</u>
--------	--------------	--------	-------------

From 13226

Take 3455

Rem. 9771

## EXAMPLE 15.

The old *Salopian Par* was presented by the *Earl of Arundel* to *King Charles the first*, at the age of 152, in the year 1635, how many years is that since?

From 1772

Take 1635

Ans. 137 years.

EXAM-

EXAMPLE 16.

Once when I was at *Marb'ry School*,

My master JORDAN he,

Seem'd very cross, and call'd me fool;

Which quite displeased me.

To me a question he propos'd,

Which almost crack'd my brain,

To solve it many hours I pos'd,

But spent my time in vain,

At length he ask'd me if I'd sped,

And with an angry frown,

I answer'd *no!* he box'd my head,

I thought he'd broke my crown.

The question was no more than this,

Which I'll to you relate,

So easy solv'd but yet alas!

Ne'er enter'd in my pate.

The diff'rence 'twixt twice twenty five,

Twice five and twenty see,

You tell me or, as I'm alive,

You'll ne'er a scholar be.

This question to some may seem a *paradoxical* affair, but 'tis no more than from twice 25 = 50, subtract twice five = 10 + 20 = 30.

		5
		5
Thus	25	—
	25	10
	—	20
From	50	—
Take	30	30
	—	—
Ans.	20 the difference	
	—	

Com-

## COMPOUND SUBTRACTION.

*To find the difference of two numbers when one or both are compound, or applicate quantities.*

### R U L E.

Your numbers placed as before,  
Deduct, the diff'rence less from more,  
But if the lower number be  
Any greater than th' top you see,  
Add up such figures more to this,  
As next denomination is;  
Then place the diff'rence down below,  
And carry one to the next row.

### Examples of Money.

#### EXAMPLE 2.

	£.	s.	d.
From	96	15	11 $\frac{1}{4}$
Take	84	19	10 $\frac{1}{2}$
<hr/>			
Rem.	11	16	— $\frac{3}{4}$
<hr/>			
Proof	96	15	11 $\frac{1}{4}$
<hr/>			

### EXPLANATION of EXAMPLES, 1st, and 2d.

Take example 1st, and begin at the least denomination saying, 1 from 2 and there remains 1 farthing, which place under the line thus  $\frac{1}{4}$ . Then subtract 4 from 5 and there remains 1 penny, which write down under its own denomination; and proceed

ceed to the shillings and say, 16 from 14 I cannot, but 16 from 20 and there remains 4, and the 14 which is above is 18, but it is more methodical to say, 16 from 14 I cannot, but 20 that I borrow to 14 is 34, 16 from 34 and there remains 18, as before. Then because you borrowed 1 pound or 20 shillings, say 1 that I borrowed and 2 is 3, 3 from 9 and there remains 6, 1 from 1 and there remains nothing, and the remainder is 6l. 18s. 1d.  $\frac{1}{4}$  which add to the line above it, and the sum will correspond with the top line, which proves the work to be right, as may be seen by the operation.

To proceed to example 2d, say 2 from 1 I cannot, but 2 from 4 and there remains 2, 2 and the 1 in the line above is 3, but it is better to say, 2 from 1 I cannot, but 4 that I borrow to 1 is 5, 2 from 5 and there remains 3 *to wit*  $\frac{3}{4}$ . Then proceed to the pence, and say 1 that I borrowed and 10 is 11, 11 from 11 and there remains nothing. Then say 19 from 15 I cannot, but 20 that I borrow to 15 is 35, 19 from 35, and there remains 16, and lastly begin with the pounds and say, 1 that I borrowed and 4 is 5, 5 from 6 and there remains 1. 8 from 9 and there remains 1, which numbers being all set down as you proceeded in the working, make the remainder or difference to be 11l. 16s. 0d.  $\frac{3}{4}$  as may be seen in the example.

### OBSERVATION.

As subtraction of money (*be the sum ever so great*) is performed after the very same manner that the two preceding examples are, it is therefore quite unnecessary to give any further explanations relating thereto, as those already given are sufficient to qualify any learner therein.

M U L-

---

# M U L T I P L I C A T I O N .

## Of Simple or abstract Numbers.

**B**Y this *compendious rule* we find,  
 More useful arts, to please the mind;  
 It teaches how *addition* may  
 Be taught in a more curious way;  
 That is, how often unity,  
 In any number there shall be.

TABLE invented by *Pythagoras*.

This table  
 must be got  
 by heart and  
 is so easy that  
 it scarce  
 needs any  
 explanation,  
 for 'tis no  
 more than  
 looking for  
 one of the  
 figures or  
 factors at the  
 top, and the  
 other at the  
 left hand side  
 and the an-  
 gle of meet-  
 ing is the  
 product, as  
 for example.  
 Suppose you  
 wanted to  
 to know which  
 , or otherwise  
 look

look for 7 on the side and 6 at the top, and in either angle of meeting you will find 42 the product of 6 times 7, or 7 times 6, by which you see that it does not signify which of the figures or factors you look for at the top or side, for if you look for either one at the top and the other at the side, the angle of meeting is sure to shew you the product.

## R U L E.

First multiply from the right hand,

According as your figures stand,

Write down what overplus you see

Above the tens, whatever they be,

Which tens to your next product add,

And soon the answer may be had;

As demonstration plain doth shew,

If you'll proceed as taught below.

## EXAMPLE I.

Multiply 6874 Multiplicand

By 4 Multiplier

27496 Product

## EXPLANATION.

To work this example you must say, 4 times 4 is 16, set down 6 and carry 1, and 4 times 7 is 28 and 1 is 29, set down 9 and carry 2 (viz. 2 tens) then say 4 times 8 is 32 and 2 is 34, set down 4 and carry 3, and lastly 4 times 6 is 24 and 3 is 27 which set down, and the product will be 27496.

\* That is, the product of 4 times 4 is 16, the words the product of, in multiplying being always understood.

† That is, the sum of 28 and 1 is 29, the words, the sum of in adding being always understood.

LEMMA

## Simple Multiplication.

71

### L E M M A.

If you take any multiplicand and write it down as many times as the multiplier consists of units (remembering as in addition, to place units under units, tens under tens &c.) and add them up the sum will be equal to the factors (*viz.* the multiplicand and multiplier) multiplied into each other.

Now to prove the foregoing Example, set down the multiplicand 4 times as *per Lemma*.

thus 6874  
6874  
6874  
6874  

---

and the sum is 27496 the same as the product.  

---

### EXAMPLE 2.

Multiply 146789  
By 6  

---

Product 880734  

---

### EXPLANATION.

Here say 6 times 9 is 54, set down 4 and carry 5, 6 times 8 is 48 and 5 is 53, set down 3 and carry 5, 6 times 7 is 42 and 5 is 47, set down 7 and carry 4, then 6 times 6 is 36 and 4 is 40, set down 0 and carry 4, 6 times 4 is 24 and 4 is 28, set down 8 and carry 2, 6 times 1 is 6 and 2 is 8, which compleats the product.

### EXAMPLE 3.

## Simple Multiplication.

## EXAMPLE 3.

$$\begin{array}{r}
 \text{Multiply} \quad 865434 \\
 \text{By} \quad 8 \\
 \hline
 \text{Product} \quad 6923472
 \end{array}$$

## EXAMPLE 4.

$$\begin{array}{r}
 \text{Multiply} \quad 756789 \\
 \text{By} \quad 12 \\
 \hline
 \text{Product} \quad 9081468
 \end{array}$$

These examples are multiplied after the same manner, as the two preceding ones.

## EXAMPLE 5.

$$\begin{array}{r}
 \text{Multiply} \quad 543214 \\
 \text{By} \quad 16 \\
 \hline
 3259284 \\
 543214 \\
 \hline
 \text{Product} \quad 8691424
 \end{array}$$

## C A S E 1.

When one of the factors consists of any number between 12 and 20, it may be multiplied in one line, as may be seen by working the last example in the following manner.

$$\begin{array}{r}
 543214 \\
 16 \\
 \hline
 \text{Product} \quad 8691424 \text{ the same as above}
 \end{array}$$

Begin

## EXPLANATION.

Begin and say 6 times 4 is 24, set down 4 and carry 2, 6 times 1 is 6 and 2 is 8 and 4 the back figure makes 12, set down 2 and carry 1, 6 times 2 is 12 and 1 is 13 and the back figure 1 makes 14, set down 4 and carry 1, 6 times 3 is 18 and 1 is 19, and the back figure 2 is 21, set down 1 and carry 2, 6 times 4 is 24 and 2 is 26, and the back figure 3 makes 29, set down 9 and carry 2, 6 times 5 is 30, and 2 is 32, and the back figure 4 is 36, set down 6 and carry 3 to 5 is 8, which set down and the product is the same as when you multiplied by each figure in the multiplier separately.

## C O R O L L A R Y.

After the same method you may multiply any number of figures expressed in the same manner, with ones before the right hand figure, by adding the back figures to the product according to their places. But this method is not so useful, and ready (in my humble opinion) as the former.

## C A S E 2.

When the multiplier contains more than one figure; multiply each figure thro' the line, and write down the products according to their places. Add them up and you will have the true product in one line.

## EXAMPLE 6.

Multiply 564217  
By 27

---

3949519  
1128434

---

Product 15233859

---

G

Begin

*Simple Multiplication.*

Begin and multiply the multiplicand by the first figure in the multiplier namely 7, and the product will be 3949519, then multiply the multiplicand by 2 the other figure of the multiplier, and the product will be 1128434 which set down according to their places, and add them together, and you will discover the true answer or product, as you may see by the example wrought in the preceding page.

EXAMPLE 7.

Multiply 941678

By 345

4708390

3766712

2825034Product 324878910

## S C H O L I U M.

To prove multiplication there are two ways, one whereof (and which I think is preferable to the other) is to multiply the multiplier by the multiplicand, and if the product is the same as the other, then the work is undoubtedly right. — To prove this take the preceding example.

345

941678

2760

2415

2070

345

1380

3105Product 324878910 the same as before

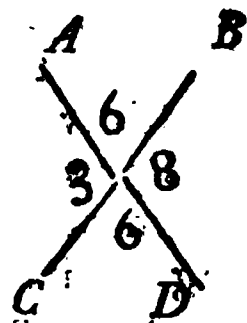

The

## Simple Multiplication.

75

The other way which is mostly taught in schools, but often liable to error, is very expeditious and is thus performed.

To prove the preceding example by this method, make a cross as *A B C D*, add up all the figures of the multiplicand, and cast away all the *nines* as you go on, thus, the first figure being 9, cast that away and say 4 and 1 is 5 and 6 is 11, *C* cast away 9 and there rests 2, then 2 and 7 is 9, and 8 remains, which place on the right hand side of the cross, then cast away the *nines* in the multiplier, thus; 3 and 4 is 7 and 5 is 12, cast away 9 and there remains 3, which place on the left side of the cross, then multiply these two numbers into each other, and cast out the *nines* in the product, thus; 3 times 8 is 24, cast away the *nines* and 6 remains which place at the top of the cross; this being done cast away the *nines* out of the product, thus; 3 and 2 is 5 and 4 is 9, then 8 and 7 is 15, cast out 9 and there rest 6, 6 and 8 is 14, cast out 9 and there rest 5, 5 and 1 is 6 (the 9 being rejected) which place at the bottom of the cross, and the product is right.

### EXAMPLE 8.

Multiply 4654301  
By 6789

41888709  
37234408  
32580107  
27925806

Product 31598049489

G 2.

CASE

C A S E 3.

Whenever it happens that one or both of the factors end with a cipher or ciphers, or have ciphers between the figures, you may neglect the ciphers and multiply the remaining figures (as taught before,) to this product annex the ciphers, but take care to write down or begin the first figure in the product, according to its place in the lesser factor, or multiplier. The following examples wrought out at full length will sufficiently explain the same.

EXAMPLE 9.

Multiply 1456789  
By 40607

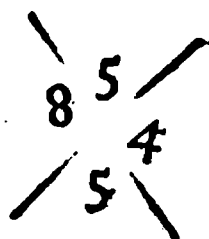

---

10197523  
8740734  
5827156

---

Product 59155830923

---

*Note.* In the above example or any other wherein there are ciphers between the figures in the multiplier; there is no occasion (unless you are so minded) to take any notice of such ciphers, but begin the product of the next figure, directly under its place in the given factor.

EXAMPLE 10.

Multiply 860074000  
By 50040020

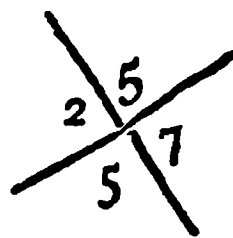

---

17201480000  
344029600000  
430037000000

---

Product 43038120161480000

---

*Note*

## Simple Multiplication.

77

*Note 2.* In this example it is needless to put down the first quantity of ciphers to the product of each single line, for you need do no more with such ciphers, than annex the number thereof in both factors on the right hand together, when you add up the product.

*CASE 4.*

When you have any factor to multiply by 10, 100, 1000 &c. annex as many ciphers thereto as there are in the multiplier, and it is done.

Multiply	1771	1771	1771
By	10	100	1000
Product	17710	177100	1771000

*CASE 5.*

When large multiplications occur, and are brought into practice, as suppose it were required to multiply 2416735 by 67489, you may make a small tariff or table, thus; make a ladder of 9 or 10 steps, against the 1st, step set the multiplicand, against the 2d, its double. the 2d, step added to the first gives the 3d step, and the 3d added to the 1st, gives the 4th step, thus proceed till you have 10 steps, which last step, being ten times the multiplicand or 1st step, proves the table to be right.

1	2416735
2	4833470
3	7250205
4	9666940
5	12083675
6	14500410
7	16917145
8	19333880
9	21750615
10	24167350

*Operation.*

	2416735
	67489
9th Step	21750615
8 —	19333880
4 —	9666940
7 —	16917145
6 —	14500410
Product	463103028415

## S C H O L I U M.

I might now introduce various other methods of contracting and working *Multiplication*, by short (tho' I may truly say tedious, perplexing, and insignificant) rules, *Nepier's Bones*, &c. but these I shall omit as useless, and proceed to give the ingenious *Tyro* a few questions for practice and improvement, and then shew the extensive use of compound multiplication; so very useful in all affairs of public business trade and commerce.

## Question 1.

Admit 100 men take a prize and each man's share amounts to 150*l*. What is the value of the prize?

*l*.  
 150  
 100

---

Answer    15000

---

## Question 2.

*A careful maid* had thirty hens,  
 Laid twenty eggs *per* day,  
 She took great care to search her pens,  
 Wherein her treasure lay.  
 The eggs she sold, the cash put by,  
 Still to increase her store,  
 Resolved was to buy a cow,  
 With five pounds and no more.  
 How many eggs, must there be sold,  
 To purchase *Tydy* \* say?  
 At five for two-pence, pray unfold  
 The same, for *Nancy Ray*.

---

\* *The name of the cow.*

First

First, multiply 100 shillings = 5l.  
 By 6 the two-pences in 1s.

2d multiply 600 two-pences  
 By 5 eggs

Answer 3000 eggs

*Note*, the number of days she will be in raising money for her cow, is easily told by division to be 150, but this must be referred to its proper place.

### Question 3.

At *Hackney* a country village in *Middlesex*, it is said there are 500 houses in it; now allowing 6 persons to each house, what number of people are there in all?

500  
 6  
 ———  
 Answer 3000  
 ———

### Question 4.

The water works at *London Bridge* are said to raise 1954 hogheads in an hour, to the height of 120 feet; now suppose they work 8 hours every day, one day with another. How many hogheads will be raised up in one year?

Multiply

Multiply 1954 the hhds. raised in an hour.  
By 8

Mult. 15632 the hhds. raised in a day.  
By 365 the days in a year

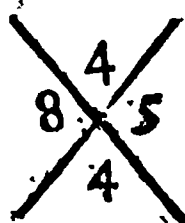

---

78160  
93792  
46896

---

Ans. 5705680 hogheads

---

### Question 5.

Near to St. *James's*, in the park you'll find,  
A fair canal delightful to mankind,  
Where sportive fishes gliding jump and play  
When *Phæbus* warms them with refulgent ray.  
The chearful warblers in soft accents sing,  
And harmony encores the joys of spring.  
The crouded mall in glitt'ring lustre shines,  
And nature's scen'ry in itself combines.  
The *duke* and *earl*, the *star* and *garter'd* knight,  
And *ladies* glance along in silver white.  
Th' area of this liquid space you'll find,  
From what you see is underneath subjoin'd\*.

To find the area of a rectangular figure (of which form the canal is) is no more than to multiply the length, by the breadth, whether it be land, water,

---

\* Length 2800 feet, breadth 100

boards,

## Simple Multiplication.

81

boards, or any other flat or superficial measure, and the product is the content or area.

$$\begin{array}{r}
 \text{Length} \quad 2800 \\
 \text{Breadth} \quad 100 \\
 \hline
 \text{Area} \quad 280000 \quad \text{Feet} \\
 \hline
 \end{array}$$

### Question 6.

*Babylon* once a famous and antient city in *Egypt*, stood upon a square of 15 miles each way. How much ground did the whole city stand upon?

Multiply 15 } the length of a side.  
 By 15 }

$$\begin{array}{r}
 75 \\
 15 \\
 \hline
 \text{Area} \quad 225 \quad \text{miles} \\
 \hline
 \end{array}$$

---

## COMPOUND MULTIPLICATION.

*To multiply numbers of different denominations by any given number, observe the following*

### R U L E.

Take care at first to multiply  
 Your prices by the quantity,  
 And when that number does exceed,  
 The number 12, besure take heed,  
 Two numbers from your table take,  
 Which multipl'd together make

The

*Compound Multiplication:*

The quantity—then multiply  
 By each, and you'll the sum descry,  
 The worth I mean, at such a price,  
 The method is exceeding nice.  
 And when your quantity's compos'd,  
 Of numbers odd, perhaps you're pos'd,  
 And scratch your head—but I'll set clear,  
 A method in an instant here.  
 Two numbers take, whose product see,  
 Comes nearest to the quantity.  
 Under or o'er, it matters not,  
 For soon an answer may be got,  
 By adding if the number's less,  
 (Than what your quantity's expens)  
 As many times the price you see  
 Is wanting, then complete you'll be.  
 But if your product shou'd make more  
 Than what your number does require,  
 Then from such quantity subtract  
 As many times the price exact,  
 And then your query solv'd will be,  
 With ease and perspicuity.

## S C H O L I U M.

Multiplication of applicate numbers, is a compen-  
 dious and short way of working the Rule of Three,  
 by an easy method, without the use of Division, and  
 is preferable to any other method, in many cases in  
 buying, selling, and computing the value of various  
 commodities, as cattle, corn, cheese, &c. &c. &c.

## EXAMPLE I.

What come 3 oxen to at ten guineas *per* ox?

$$\begin{array}{r}
 \text{£.} \quad \text{s.} \\
 10 \quad 10 \\
 \quad \quad 3 \\
 \hline
 \end{array}$$

Answer  $\underline{31 \quad 10}$

When

## Compound Multiplication.

83

When you are to multiply compound quantities, always begin with the lowest denomination, and carry to the next, writing down the overplus under its own denomination, and to work this example say, 3 times 10 is 30 shillings or 1l. 10s. write down 10 and carry 1, then say 3 times 10 is 30 and 1 is 31 pounds, which set down and the answer is 31l. 10s. as may be seen in the example.

### EXAMPLE 2.

What come 6lb. of sugar to at  $5\frac{1}{4}$  per pound?

d.

$5\frac{1}{4}$   
6

Answer  $2\ 7\frac{1}{2}$

Here say 6 times 1 is 6 farthings or 1d halfpenny, set down  $\frac{1}{2}$  and carry 1, then 6 times 5 is 30, and 1 is 31 pence or 2s. 7d. which enter down and the product is 2s. 7d.  $\frac{1}{2}$  the answer to the question.

### EXAMPLE 3.

What do 9 yards of Irish cloth come to at 2s. 4d.  $\frac{1}{2}$  per yard?

s. d.

2  $4\frac{1}{2}$   
9

Answer  $1\ 1\ 4\frac{1}{2}$

EXAM-

## EXAMPLE 4.

What come 12 c. of cheese to at 13s. 6d. per hundred?

$$\begin{array}{r}
 \text{L. s. d.} \\
 1 \quad 13 \quad 6 \\
 \quad \quad 12 \\
 \hline
 \text{Answer } 20 \quad 2 \quad -
 \end{array}$$

*Note, cheese-factors and many other dealers, who buy goods by wholesale, are allowed 120 lb. or 6 score to 1 c. wt. but sell them out at 112 lb. per c. wt.*

## EXAMPLE 5.

What do 15 measures, or bushels of wheat come to at 6s. 9d  $\frac{1}{2}$  per bushel?

$$\begin{array}{r}
 6 \quad 9\frac{1}{2} \\
 \quad \quad 5 \\
 \hline
 1 \quad 13 \quad 11\frac{1}{2} \text{ price of 5 meas.} \\
 \quad \quad 3 \\
 \hline
 \text{Answer } 15 \quad 1 \quad 10\frac{1}{2}
 \end{array}$$

*Note, when the multiplier or given quantity is greater than 12, you must consider what 2 or more numbers multiplied together or continually make the quantity given, and multiply the given rate or price by either or any of those numbers (it matters not which you use first) and that product by the second and if you make use of any more numbers proceed in like manner, and the final product will be the answer as may be seen by the preceding example and the following ones.—And if the given quantity be ever so great, you may in like manner discover the value thereof, by finding the value of the greater and lesser numbers, and adding them together as directed by the *Lemma* at the end of this rule.*

EXPLA-

## EXPLANATION of Example 5.

To work this Example say, 5 times 2 is 10 farthings or 2 pence  $\frac{1}{2}$  set down  $\frac{1}{2}$  and carry 2, then say 5 times 9 is 45 and 2 is 47 pence = 3s. 11d. set down 11 and carry 3, then 5 times 6 is 30 shillings and 3 is 33, = 11. 13s. the first product being finished, multiply that by the other number saying, 3 times 2 is 6 farthings or 1d.  $\frac{1}{2}$ , set down  $\frac{1}{2}$  carry one and say, 3 times 11 is 33, and 1 is 34 pence = 2s 10d. set down 10, and carry 2, then 3 times 3 is 9 and 2 is 11, set down 1 and carry 1 and say, 3 times 1 is 3 and 1 is 4, 4 ten shillings, or 2l. then 3 times 1 is 3 and 2 is 5l. and the answer is 5l. 1s. 10d.  $\frac{1}{2}$ .

## EXAMPLE 6.

A *dairy maid* deck'd with an air,  
 Each market-day you'll see,  
 Who brings to town her *country ware*,  
 Amiable and free.  
 Eggs, butter, bacon, cheese to sell,  
 Good housewifery suppose,  
 Which does become the *fair one* well,  
 She blooming as the rose.  
 Her butter's value *Tyro* shew  
 And each commodity,  
 Say what do *eighteen pounds* come to,  
 At *four pence halfpenny*? \*  
 And *six score eggs* when *five* are sold,  
 For *two pence* and no more,  
 All this with ease you may unfold,  
 And likewise too explore  
 What *thirty pounds* of cheese come to,  
 At *three pence farthing* say, \*

---

\* Per pound.

H

AU

*Compound Multiplication.*

All this with ease you'll quickly do,  
Come haste make no delay.

Suppose *per pound* her bacon fold,

At *five pence farthings three*,

Take *Wilkes's* number  $\frac{1}{2}$  and unfold,

$\frac{1}{2}$  45

The value true to me.

d.

1st,  $4\frac{1}{2}$

9

---

S 3  $4\frac{1}{2}$

2

---

S 6 9 value of the butter.

2d. It is evident as the eggs were sold out at 5 for two pence, 24 or its component parts must be the multiplier for  $5 \times 24 = 120$  the whole number of eggs.

Then  $24 \times 2 = 48d. = 4s.$  the value of the eggs.

d.

3d.  $3\frac{1}{4}$

10

---

 9 \\
 \hline
 \end{array}$$

Answer £ 7 12 7  $\frac{1}{2}$

EXAMPLE 12.

Old Farmer Careful fond of pelf,  
To Badger Fairtongue sold  
His wheat, and seems to hug himself,  
And smile upon the gold.  
A hundred bushels were agreed,  
The badger straight to bring,  
At nine and six-pence! \* true indeed,      \* per bushel  
It made old Careful sing.  
What did the whole come to declare,  
Which pleased Clod so well,  
And made him hobble sing and stare,  
Ingenious Tyro tell?

$$\begin{array}{r}
 \text{s.} \quad \text{d.} \\
 9 \quad 6 \\
 10 \\
 \hline
 4 \quad 15 \quad - \\
 10 \\
 \hline
 \end{array}$$

Answer 47 10 -

*Compound Multiplication.*

## EXAMPLE 13.

What will 144lb. of tea come to, at 4s. 6d.  $\frac{1}{2}$  per pound?

$$\begin{array}{r} s. \quad d. \\ 4 \quad 6 \quad \frac{1}{2} \\ 12 \end{array}$$

$$\begin{array}{r} 2 \quad 14 \quad 6 \\ 12 \end{array}$$

$$\text{Answer } \underline{\underline{\pounds \quad 32 \quad 14 \quad -}}$$

## EXAMPLE 14.

What come 19lb. of figs to, at 3d.  $\frac{3}{4}$  per pound?

d.

$$\begin{array}{r} 3 \quad \frac{3}{4} \\ 6 \end{array}$$

$$\begin{array}{r} 1 \quad 10 \quad \frac{1}{2} \\ 3 \end{array}$$

$$\text{Add } \left\{ \begin{array}{r} 5 \quad 7 \quad \frac{1}{2} \\ 3 \quad \frac{3}{4} \end{array} \right\} \text{ price of } \left\{ \begin{array}{r} 18\text{lb.} \\ 1 \end{array} \right.$$

$$\text{Answer } \underline{\underline{\pounds \quad 5 \quad 11 \quad \frac{1}{4} \quad \text{price of} \quad 19}}$$

In this example as no two numbers multiplied together make the quantity, I take the two nearest under it, which are 6 and 3 for  $6 \times 3 = 18$  then 1 remains, the price of which must be added to the value of 18, and consequently the sum will be the price of 19 as above.

EXAM.

# Compound Multiplication.

91

## EXAMPLE 15.

What come 38 sheep to, at 6s. 9d. *per* sheep?

s. d.

6 9

## LEMMA.

When any large sum or sums occur in practice, as hundreds, thousands, &c. 1st, multiply the price by 10. and that product by 10 for the value of one hundred. Then multiply that product by the number of hundreds. And for the lower numbers multiply the price of 10 by the number of tens, which product write down under the value of hundreds; and then for the units multiply the price by their number which add to the other products and the sum will be the value of the whole. If your quantity is thousands, multiply the price of 100 by 10 for 1000, and the product by the number of thousands. And for the lower quantities proceed as above. The following example will make this sufficiently clear to be understood.

What

EXAMPLE.

What come 8462lb. of iron to, at 2d.  $\frac{3}{4}$  per pound?

d.

2  $\frac{3}{4}$  the price of 1lb.

## EXPLANATION.

To work this example set down the divisor and dividend as in the work, then ask how oft 4 in 6, once, place 1 in the quotient and multiply the divisor 4 thereby, saying once 4 is 4, which set down under 6 in

in the dividend and subtract saying, 4 from 6 and there remains \* 2, to which bring down 9 the next figure in the dividend (and to avoid making mistakes in bringing down the right figure, it will be necessary to prick under each figure in the dividend as you bring them down) then ask how oft 4 in 29 answer 7, which place in the quotient and say 7 times 4 is 28 which set down under 29 and subtracting 28 from 29 there remains 1, to which bring down the next figure in the dividend namely 1, then ask how oft 4 in 11, 2 times, place 2 in the quotient and say, 2 times 4 is 8 which set down under 11, and say 8 from 11 and there remains 3, to which bring down the next figure 6, and ask how oft 4 in 36, place the answer 9 in the quotient and say, 9 times 4 is 36 which set down under 36 and subtract and there remains nothing, then bring down the next figure 7 and ask how oft 4 in 7 place 1 the answer in the quotient and say once 4 is 4 which set down under 7 and subtract saying 4 from 7 and there remains 3, then bring down 2 the last figure in the dividend and say, how oft 4 in 32, set down the answer 8 in the quotient and multiply the divisor thereby saying, 8 times 4 is 32, 32 from 32 and there remains nothing and the work is finished, whereby it appears that the *figure or number 4 is contained in 691672 just 172918 times*, to discover which was the thing required. This question is the same, as if one should ask in 691672 farthings how many pence? the answer wou'd be 172918 pence:

---

\* That is, there remains *the number 2*, or *the number 2* remains, *the number* in such cases being always understood.

EXAMPLE 2.

**EXAMPLE 2.****Divide 86547 by 7**

$$\begin{array}{r}
 7 \overline{) 86547} \quad (12363 \\
 \underline{7 \phantom{0000}} \\
 16 \\

(36 miles and 2 fifths of a mile =  
 704 yds. for 2  $\times$  1760 (the yds.  
 in a mile) = 3520  
 divided by 5 = 704.

EXAMPLE 5.  
 Divide 89012 by 24

$$24 \overline{) 89012} \quad (3708$$

72

170

168

212

192

20 remains

*EXPLANATION of Example 5.*

Having placed the numbers as in the work, ask how oft 24 in 89, or which is better, how oft 2 in 8, and you may soon discover that 4 times will be too many, for 4 times 2 is 8, and you will have 1 to carry thereto from the other figure in your divisor, therefore place 3 in the quotient and multiply the divisor thereby, saying 3 times 4 is 12 set down 2 under the 9 and carry 1 and say, 3 times 2 is 6 and 1 is 7 which set down under the 8 and subtract, saying 2 from 9

and

## Simple Division.

111

and there remains 7, 7 from 8 and there remains 1, then bring down the 0 and enquire how oft 2 in 17, which will be but 7 times because you will have 2 to carry from the other figure of the divisor, therefore set down 7 in the quotient and multiply the divisor thereby, the product is 168 which place under 170, then subtract and the remainder is 2, bring down the next figure (of the dividend) 1 and see how oft the divisor 24 in 21, answer 0 times, place a cipher in the quotient and bring down 2 the last figure of the dividend, then seek how oft 24 in 212, or how oft 2 in 21, the two first figures in the new dividend, which cannot be 9 times because 9 times 24 is 216 which you cannot take from 212 so you see it will be but 8 times, then place 8 in the quotient and multiply the divisor thereby and the product will be 192. which place under 212 and subtract as before, and there remains 20, which set down and the work is finished, and the quotient is found to be 3708 and 20 remaining. This question is the same as if one should ask in 89012 halfpence, how many shillings? the answer would be 3708 shillings and 20 halfpence or ten-pence remaining.

---

*Note.* The remainder after every subtraction is always to be less than the divisor, otherwise the work is wrong and must be rectified (before you can proceed farther) by increasing the last found figure in the quotient until the remainder be less, and you must never bring down from the dividend more than one figure at a time, and for every figure you bring down, place or put a figure or cipher in the quotient.

*Simple Division.*

EXAMPLE 6.

$$47 \overline{) 8460} \quad (180$$

47

## S C H O L I U M.

There are various ways of proving division, and for the exercise of the learner I shall prove it by three different ways, first by multiplying the quote by the divisor, secondly by casting away the *nines* as in multiplication, and lastly by addition.

*First Method.*

Take the quotient of the last example and multiply it by the divisor.

thus 180

47

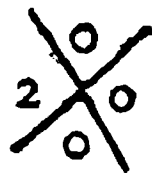

1260

720

8460 Same as the dividend.

*Second Method.*

Take the same example and cast away the *nines* in the divisor and quotient, which put on each side of the cross, and cast away the *nines* out of the dividend, put the remainder at top of the cross, then multiply the side

figures

figures thereof into each other, and cast the *nines* out of the product, and if the work be right, the remainder to be wrote at the bottom of the cross, will be the same as the top, as may be seen by this example.

*The third method is thus,* Add the last remainder and all the products of the divisor and quotient together as they stand in the work, and the sum will be the same as the dividend, as appears in the proof of the following example.

## EXAMPLE 7.

Divide 746789 by 345

345) 746789 (2164

\* 690

567

\* 345

2228

\* 2070

1589

\* 1380

\* 209 last remainder

Proof 746789

Now to prove this example add up all the lines mark'd thus \* and as there is nothing but a cipher to add the 9 (in the last remainder) to, put it down, and for the same reason put down 8, then say 2 and 3

K 3 is

# *Simple Division.*

is 5 and 7 is 12 and 5 is 17, set down 7 and carry 1, then 1 and 1 is 2 and 4 is 6, set down 6, and say 2 and 3 is 5 and 9 is 14, set down 4 and carry 1, 1 and 6 is 7, which set down and the sum is the same as the dividend, and proves that the division was performed right.

## EXAMPLE 8.

Divide 123456789 by 6004.

$$\begin{array}{r} 6004 \overline{) 123456789} \end{array} \begin{array}{l} (20562 \\ 12008 \end{array}$$

$$\begin{array}{r} 33767 \\ 30020 \\ \hline \end{array}$$

$$\begin{array}{r} 37478 \\ 36024 \\ \hline \end{array}$$

$$\begin{array}{r} 14549 \\ 12008 \\ \hline \end{array}$$

2541 remains

$$\begin{array}{r} \text{Quotient } 20562 \\ \text{Divisor } 6004 \end{array}$$

$$\begin{array}{r} 82249 \\ \hline \end{array}$$

$$\begin{array}{r} 12337454 \\ \hline \end{array}$$

Proof

$$\begin{array}{r} 123456789 \\ \hline \end{array}$$

*Note.* In proving division by multiplying the quotient by the divisor, if there be any remainder you must add it in, as you multiply *i. e.* when you multiply by units add

the units, and when by tens add the tens &c. as you may see by the proof of this example.

## EXAMPLE 9.

## Simple Division.

115

EXAMPLE 9.

Divide 987654321 by 123456

123456) 987654321 (8000  
       987648

—————  
           6321 rem.

To prove this example (and all others in division that have remainders) by the cross, you must, after having cast out the *nines* in the quotient and divisor and placed the remainder on each side of the cross, cast the *nines* out of their product, and what remains over, add to the remainders at the bottom of the work casting out the *nines* and place the overplus at the top of the cross; then cast out the *nines* in the dividend, and the remainder you must place at the bottom of the cross, which will be the same as the top if the work be right, as may be seen by the proof of this example.

### COROLLARY.

When you have large numbers to divide by, you may often (if not always) by inspection, tell how many times your divisor is contained in its proper period or dividual, by observing how oft the two first figures on the left hand, are contained in the two first of the dividual.

### Contractions in Division.

#### CASE 1.

When you have ciphers on the right hand of your divisor, cut off the ciphers, and also the same number of figures on the right hand of your dividend, which figures bring down to the right hand of your remainder, when the work is finished.

Divide

Divide 1772 by 20

$$\begin{array}{r} 2 \overline{) 1772} \quad (88 \\ 16 \end{array}$$

$$\begin{array}{r} 17 \quad 88 \\ 16 \quad 20 \\ \hline \end{array}$$

Rem. 12 1772 Proof.

*Note.* In this example I cut off the cipher and one figure in the dividend, and divided only by 2.

Divide 4816700 by 12000

$$12 \overline{) 000} 4816 \overline{) 700} \quad (401 \text{ Quotient}$$

$$48 \quad \text{Proof}$$

$$401 \times 12000 + 4700 = 4816700.$$

$$16$$

$$12$$

4700 remains

Divide 946789 by 10000

Quotient.

$$1 \overline{) 0000} 94 \overline{) 6789} \quad (94 \frac{6789}{10000}$$

$$9$$

Proof

$$4 \quad 94 \times 10000 + 6789 = 946789.$$

$$4$$

6789 remains

## CASE 2.

When the divisor does not exceed 12 there will be no occasion to set down the operation at large, for it may be performed by multiplying and subtracting mentally, and writing down the quotient under the dividend as may be seen in the following examples.

Divide 456789 by 8

$$8 \overline{) 456789}$$

$$\text{Quote } \underline{57098} \text{ --- } 5$$

Proof

$$\begin{array}{r} 8 \overline{) 3} \\ 3 \overline{) 2} \end{array}$$

Divide 546294 by 12

$$12 \overline{) 546294}$$

$$\underline{45524} \text{ --- } 6$$

$$12$$

$$\text{Proof } \underline{546294}$$

**EXPLANATION of Example 1st.**

To work this example ask how oft 8 in 45, answer 5 times, set down 5 under the dividend, and say 5 times 8 is 40 from 45 and there remains 5 which makes the following figure 56, then say how oft 8 in 56, 7 times 8 is 56 from 56 and there remains nothing, then ask how oft 8 in 7 nought times, set down 0 and there remains 7, which makes the following figure 78, then say how oft 8 in 78, 9 times 8 is 72, from 78 and there remains 6 which makes the following figure 69, then seek how oft 8 in 69, 8 times 8 is 64 from 69 and there remains 5, which (as there is no more figures in the dividend) set down at the end of the quotient as a remainder and the work is completed.

C A S E 3.

## C A S E 3.

When it happens that the divisor is the product of two or more numbers; you may divide by those numbers or component parts, which is much easier than dividing by all the divisor at once, see the following example.

Divide 946002 by 72

$$12) 946002$$

$$\begin{array}{r} 6) \quad 78833-6 \\ \hline \text{Quote } 13138-5 \\ \quad \quad 6 \end{array} \left. \vphantom{\begin{array}{r} 6) \quad 78833-6 \\ \hline \text{Quote } 13138-5 \\ \quad \quad 6 \end{array}} \right\} 66$$

$$\begin{array}{r} \hline 78833 \\ \quad 12 \\ \hline \end{array}$$

Proof 946002

*Note.* In proving by multiplication this example (and all others of the like kind) you must add or take in separately the two remainders when you multiply by their respective divisors that produced them, or which pertain thereto. And to bring these 2 remainders into

one you must multiply the first divisor into the last remainder, and add the first remainder in, as in this example 12 times 5 is 60 and add 6 (the first remainder) thereto, the sum is 66 which will remain when the dividend in this example is divided at one operation by 72. But when there is 2 divisors and but one remainder, and that proceeds from the last divisor, then the product of the 1st divisor and that remainder will be the remainder sought. But when there is 2 divisors and one remainder and it proceeds from the 1st divisor, then that remainder is the remainder.

C A S E 4.

# Simple Division.

119

## C A S E 4.

In large divisions you may make a tariff or table (as taught in multiplication) by making products of the divisor and the 9 digits, which is done by continually adding the divisor, by which tariff or table any large divisions are wrought by inspection, and to do which you are only to take out of the table the nearest less number to the dividual, and the quote figure along with it, which number must be continually subtracted from each dividual as before taught. The following example will make this clear.

Divide 41690314975 by 406502.

1	406502
2	813004
3	1219506
4	1626008
5	2032510
6	2439012
7	2845514
8	3252016
9	3658518
10	4065020

406502) 41690314975 (102558.  
406502

1040114  
813004  
2271109  
2032510  
2385997  
2032510  
3534875  
3252016

8 4  
4 3

Remains 282859

## C A S E 5.

Those who are well acquainted with the nature of division, may even in the largest divisions, subtract each figure of the product as it is produced, and write down *only* the remainders. This is commonly called the short *Italian* division, to perform which take the last example.

divide

406502) 41690314975 (102558

1040114

2271109

2385997

3534875

282859 remains as before.

### SCHOLIUM.

Having now sufficiently explained *Simple Division*, I shall give two or three more questions for exercise, and then proceed to applicate numbers, or division of component parts.

#### Question 1.

In the *Spectators*, number nine,  
Where eloquence makes learning shine,  
Sir *Richard Steele*, or *Addison*  
Describe a wond'rous set of men.  
A club of men, exceeding queer,  
As fat as bacon hogs they were;  
True brawny bacchanalian souls  
Who swill in large capacious bowls.  
And bellies mounted to the chin,  
A hoghead might be lost therein.  
The *fifteen members* of this club,  
Whose weight when weigh'd by Mr. *Scrub*,  
Was just *three tons*, it was no more,  
The weight of each then pray explore.

To answer this question is only to divide 60 (the hundreds in 3 tons) by 15 the number of men,

thus 15) 60 (4 c. the weight of each  
man.

## Question 3. For the Ladies.

A *Governess* who well observ'd  
 The morals of the *fair*,  
 To see her *pupils* never swerv'd  
 From virtue, took great care,  
 Just *five and twenty Ladies* she  
 Instructed, in each art,  
 Which does display to company,  
 The most accomplish'd part.  
 In *Needle-work*, and *Music* few  
 Could *Governess* excel,  
 She taught them *French* and *Dancing* too,  
 Incomparably well.  
 Both *Reading*, *Writing* and *Accounts*,  
 Grammatically were,  
 With freedom taught, each *Lady* mounts  
 An elevated sphere.  
 To make her sex with brilliance shine,  
 She took peculiar care,  
 When genius does with sense combine,  
 To grace the lovely fair.  
 And to encourage sprightly youth,  
 Upon a certain day,  
*Three hundred sugar plums* in wrath,  
 She frankly gave away.  
 What number was each *Lady's* share,  
 Ingenious fair ones say?  
 Which pleas'd no doubt the brilliant fair,  
 And made them dance and play.

## COMPOUND DIVISION.

*To divide numbers of different denominations by a given number, observe the following*

### R U L E.

When your divisors single are,  
To work your dividend prepare;  
Your highest number first divide,  
Be what it will on the left side.  
Let each denomination be  
The same, and with your quote agree,  
What rests reduce and add unto  
The next inferior one you view,  
Thus thro' your dividend go on,  
But if your number's more than one  
That you divide by, then you may  
Work by their parts, an easy way,  
When your divisors shall agree,  
In equal products quaint and free.

### LEMMA.

This useful and excellent method of division teaches how to find the price of 1 &c. in a more concise manner than the rule of Three or Reduction, for any person who has learned the four first rules in arithmetic, may easily by thought and memory bring out a final quote or answer, without a great multiplicity of figures, as will appear by the following examples. To prove compound division, multiply the quotients by the proper divisors.

## EXAMPLE 1.

Suppose 7 men are to pay a reckoning of 1l. 15s. 1d.  $\frac{3}{4}$ . What must each man pay?

$$\begin{array}{r}
 \text{7) } \begin{array}{c} \text{£. s. d.} \\ 1 \ 15 \ 1 \ \frac{3}{4} \end{array} \\
 \hline
 \text{Answer} \quad - \quad 5 \quad - \quad \frac{1}{4} \\
 \hline
 \text{Proof} \quad \begin{array}{c} 1 \ 15 \ 1 \ \frac{3}{4} \\ \hline \end{array}
 \end{array}$$

## EXPLANATION.

To work this example ask how oft 7 in 1, never a time, then 1l. = 20s. added to 15s. is 35s. then ask how oft 7 in 35, 5 times, put down 5 in the quotient and say 35 from 35 and there remains nothing, then ask how oft 7 in 1d. never a time and there remains 1, one penny is 4 farthings and 3 is 7 how oft 7 in 7 once, set down 1 farthing and the answer is 5s.  $\frac{1}{4}$ .

## EXAMPLE 2.

A Lady had nine Daughters fair  
 Of bright accomplish'd parts,  
 Their graces, smiles, and pleasing air,  
 Attracted lovers hearts;  
 Young Damon, Sylvius, many more,  
 Their utmost art essay'd,  
 To gain these fair ones and implore  
 The favours of each maid.  
 The Mother was possess'd we find  
 Of eighty hundred pound,  
 And being virtuous, just and kind,  
 An equal share left round  
 To be distributed with care,  
 Amongst her daughters nine,  
 Each Lady's fortune pray declare?  
 To make your learning shine.

# Compound Division.

125

$$\begin{array}{r} \text{L. s. d.} \\ 9) 8000 \end{array}$$

Answer 888 17 9  $\frac{1}{2}$

$$\text{Proof } 8000$$

First ask how oft 9 in 80, answer 8 times, repeat the operations and 8 will remain in the pounds, which reduce to shillings and proceed thro' all the

denominations, and each Lady's fortune will appear to be as above. To prove which take in the remainder to the farthings.

## EXAMPLE 3.

If 18 cheeses (of equal weight) cost 7l. 9s. 3d. What is the price of one?

$$\begin{array}{r} \text{L. s. d.} \\ 6) 7 \ 9 \ 3 \end{array}$$

$$\begin{array}{r} 3) 1 \ 4 \ 10 \ \frac{1}{2} \end{array}$$

$$\text{Answer } - \ 8 \ 3 \ \frac{1}{2}$$

In this example make use of two numbers viz. 6 and 3 whose product is 18.

$$\text{Proof } 7 \ 9 \ 3$$

	<u>        </u>	£. 2	19 6
Answer	28 roods.		<u>        </u>
			4
			<u>        </u>
			7) 11 18 - whole sum
			<u>        </u>
			Answer £ 1 14 - each man's
			<u>        </u> share.

## EXAMPLE 9.

At a hunting suppose *six score* Gentlemen be,  
 All sons of fair freedom and dear *Liberty*;  
 The banquet prepar'd with old *Baniface* dipe,  
 To feast and carouse over punch ale and wine.,

\* Per rood of 72 solid yards,      With

With punch bowl and ladle they fill drink and sing  
 And seem to adore mighty *Bacchus* the king.  
 For Bacchanals who favour the bottle and glass,  
 Will smile on full bumpers wherever they pass.  
 If *sixty-three pounds* do the reckoning defray,  
 Then what must *each Gentleman* equally pay?

$$\begin{array}{r} \text{£.} \\ 12 \overline{) 63} \\ \hline \end{array}$$

$$10 \overline{) 55} \text{ s.}$$

Ans. S 10 6 d. each.

## EXAMPLE 10.

If 1 hund. weight of hops \* cost 6l. 15s. 4d. What is the price of 1 pound?

$$\begin{array}{r} \text{£.} \quad \text{s.} \quad \text{d.} \\ 2 \overline{) 6 \quad 15 \quad 4} \\ \hline \end{array}$$

$$7 \overline{) 3 \quad 7 \quad 8}$$

$$8 \overline{) - \quad 9 \quad 8}$$

Answer - 1 2½

\* See example 21 page 94. this being the reverse of that and requires 3 divisions.

## C O R O L L A R Y.

When the divisor can't be produced by multiplication of small numbers, you must divide as in long division.

EXAM-

## EXAMPLE 11.

Divide 100l. 4s. 6d.  $\frac{1}{2}$  into 52 parts.

$$\begin{array}{r} \text{52) } \begin{array}{ccc} \text{£.} & \text{s.} & \text{d.} \\ 100 & 4 & 6 \frac{1}{2} \end{array} \end{array}$$

52

—

48

20

—

$$\text{52) } 964 \text{ (18 s}$$

52

—

444

416

—

28

12

—

$$\text{52) } 342 \text{ (6 d.}$$

312

—

30

4

—

$$\text{52) } 122 \text{ (}\frac{1}{2}\text{}$$

104

—

18

—

*Note,* In this example each remainder is reduced to the next inferior denomination, and each sum whether shillings pence, or farthings added thereto.

$$\text{Ans. } \begin{array}{ccc} \text{£.} & \text{s.} & \text{d.} \\ 1 & 18 & 6 \frac{1}{2} \frac{2}{3} \end{array}$$

*Note,*

*Note.* The following question I proposed many years ago, which was published in the *Palladium* for 1760, and afterwards taken into *Birks's Arithmetic*, and as it seems a pretty exercise for the learners of division, I shall therefore give it in this place before I proceed any further.

## QUESTION.

A worthless *Miser* as I'm told,  
 Had hoarded up vast store of gold ;  
 Large sums put out to usury,  
 Till aged *fourscore Years* and *three*  
 When death depriv'd him of his self.  
 And took him from his second self :  
 Of wives it happen'd he'd had *three*,  
*Three* Sons, and Daughters *two* had he.  
 His third wife did survive him still,  
 But mark the tenor of his will :  
 Of rusty gold ten thousand pound,  
 Was in this *Miser's* coffer found ;  
 Each Son must be paid down in store  
 Each Daughter's fortune three times o'er ,  
 Each Daughter as the will was made  
 Must twice the widow's part be paid :  
 Now the old *Miser's* in his grave,  
 Tell me the fortune each must have.

## SOLUTION.

It is evident by the nature of the question, that for the widow's share, 2 daughters had 4 shares, and 3 sons 18 shares; whence  $1 + 4 + 18 = 23$ , a divisor for the widow's part, now you must proceed to divide 10000 by 23 (as per last Example.)

Divide

$$\begin{array}{r} \text{23) } 10000 \quad \text{£.} \quad \text{s.} \quad \text{d.} \\ \quad \quad \quad (434 \quad 15 \quad 7 \frac{3}{4} \frac{7}{23} = \text{Widow's} \\ \text{which sum } \times \text{ by} \quad \quad \quad 2 \quad \quad \quad \text{part.} \end{array}$$

$$\begin{array}{r} \quad \quad \quad 869 \quad 11 \quad 3 \frac{1}{2} \frac{14}{23} = \text{each daughter's} \\ \text{multiply by} \quad \quad \quad 3 \quad \quad \quad \text{part.} \end{array}$$

$$\begin{array}{r} \quad \quad \quad 8608 \quad 13 \quad 10 \frac{3}{4} \frac{12}{23} = \text{each son's} \\ \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \text{part.} \end{array}$$

### C O R R O L L A R Y.

There being fractional parts in the above  $\frac{7}{23}$  &c. you must multiply the parts, and if the products exceed the divisor, subtract the divisor 23 from the same and carry 1 to the farthings as you see above, when you say 3 times 14 is = 42 subtract 23 from 42 and there rest 19, which makes  $\frac{19}{23}$  and 1 farthing to carry to make  $\frac{3}{4}$  in each sons share.

### Of WEIGHTS MEASURES, &c.

Divide 23lb. 6 oz. 10 dwt. 20 gr. by 5. \*

$$\begin{array}{r} \text{lb.} \quad \text{oz.} \quad \text{dwt.} \quad \text{gr.} \\ 5) \quad 23 \quad 6 \quad 10 \quad 20 \\ \hline \text{Answer} \quad 4 \quad 8 \quad 10 \quad 4 \end{array}$$

\* See example 1. page 30. Here as division is the reverse of multiplication I shall divide a few of those examples to facilitate division, and then proceed to reduction &c. To work the above example ask how oft 5 in 23, 4 times and there remains 3, then 3 times 12 is 36 and 6 is 42 oz. then ask how oft 5 in 42, 8 times, and there remains 2, two ounces or 40 dwt. 40 and 10 is 50, then how oft 5 in 5 once, how oft 5 in 0, nought times,

times, then ask how oft 5 in 20, 4 times which compleats the quotient. In the same manner all weights and measures (paying a due regard to their several denominations) are divided with ease and accuracy.

**EXAMPLE.**

Divide 22lb. 5 oz. 3 dr. - scr. 4 gr. by 7.  
 lb. oz. dr. scr. gr. *see page 95.*

$$\begin{array}{r} 7 \overline{) 22 \quad 5 \quad 3 \quad - \quad 4} \end{array}$$

**Answ.**  $\underline{\underline{3 \quad 2 \quad 3 \quad 2 \quad 12}}$

**EXAMPLE.**

Divide 56 lb. 11 oz. and 8 drt by 12. *see page 96.*  
 lb. oz. dr.

$$\begin{array}{r} 12 \overline{) 56 \quad 11 \quad 8} \end{array}$$

**Answ.**  $\underline{\underline{4 \quad 11 \quad 10}}$

I shall now beg leave to conclude this rule as the learner by this time (*having had so many examples and explanations*) cannot but be able to comprehend or surmount every difficulty that can possibly occur relating to division of any kind, and to effect which was my chief motive of dwelling so long therein.

**M**

**P R O.**

## PROMISCUOUS QUESTIONS.

Question 1. By Mr. Charles Hutton.

The remainder of a division is 325, the quote 467, the divisor is 43 more than the sum of both. What is the dividend?

*Sol.* By the nature of the question and the rules in division  $325 + 467 + 43 = 835 \times$

$467 + 325 = 390270$ . Answer.

*Operation at length.*

325
467
—
792
43
—

multiply 835 the divisor  
by 467 the quote, and take in 325 the remainder.

5850
5012
3343
—

Anf. 390270 = dividend as above.

Mr. Hutton's Solution being wrong printed as I imagine.

Question 2.

Question 2. by Mr. Clare.

By selling 240 Oranges at 5 for two-pence, half of which cost me two a penny, and the other half, 3 a penny I evidently lost a groat, pray how comes that about?

First. 240

2

5) 480

d. 96 = what sold for

2d.  $\frac{1}{2}$  120 = 60 and  $\frac{1}{3}$  120 = 40 then 60 + 40 = 100  
(what bought for.

d.

or thus 2) 120 (60

From 100

Take 96 -

3) 120 (40

rem. 96

The following Question (as Mr. Malcolm justly observes) requires all the four operations of Arithmetic.

Question 4.

Question 4. by Mr. Malcolm.

A Father left among 5 Sons an estate, consisting of 500*l.* in cash, with 5 bills, each of 48*l.* 10*s.* 6*d.* he ordered 20*l.* to be bestowed upon his burial, and his debts to be paid amounting to 164*l.* Then his free estate to be divided in this manner *viz.* The eldest Son to have the 3*d.* part, and the other 4 Sons to have equal shares. What is the share of each Son?

Operation.

<i>l.</i>	<i>s.</i>	<i>d.</i>		<i>l.</i>	
48	10	6		20	Burial expences
		5	Bills	164	Debts
<hr/>				<hr/>	
242	12	6	A. of the B.	184	Total of out
500	-	-	Cash		goings
<hr/>				<hr/>	
742	12	6	Total		
184	-	-	Deduct		
<hr/>				<hr/>	
3)	558	12	6	Free estate	
sub.	186	4	2	Eldest son's share	
<hr/>				<hr/>	
4)	372	8	4	Remains to be divided amongst the	
				other sons	
	93	2	1	The share of each of the other four	
	<hr/>			sons.	

R E D U C T I O N.

**R**EDUCTION teacheth to convert  
 The names of numbers most expert,  
 But the same value still retain,  
 As underneath I shall explain.  
 It is compounded as you'll find  
 With all the former rules combin'd.

M 3

RULE.

## R U L E.

When your *Reduction* must *descend*,  
 Observe the *frictions* of a friend,  
 The given number multiply  
 With each denomination by,  
 Add to each product as you go,  
 The next inferior one below ;  
 And when *Ascending* you divide  
 Just by the same you multiply'd,  
 The numbers then revers'd appear,  
 And prove each other very clear.

## EXAMPLE I.

In 1/. how many shillings, six-pences, three-pences, pence, half-pence and farthings?

$$\begin{array}{r}
 \text{£.} \\
 1 \\
 \hline
 20 \\
 \hline
 20 \text{ shillings} \\
 2 \\
 \hline
 40 \text{ six-pences} \\
 2 \\
 \hline
 80 \text{ three-pences} \\
 3 \\
 \hline
 240 \text{ pence} \\
 2 \\
 \hline
 480 \text{ halfpence} \\
 2 \\
 \hline
 960 \text{ farthings} \\
 \hline
 \end{array}$$

To work this example and all others of the kind, you must multiply by each next inferior denomination from the given one, to that sought.

EXAM

**EXAMPLE 2.**

**How many farthings are there in 765l.?**

$$\begin{array}{r}
 \text{£.} \\
 765 \\
 \times 20 \\
 \hline
 15300 \text{ shillings} \\
 \times 12 \\
 \hline
 183600 \text{ pence} \\
 \times 4 \\
 \hline
 734400 \text{ farthings} \\
 \hline
 \end{array}$$

**Or thus**  $\begin{array}{r} \text{£.} \\ 765 \end{array}$  960 farthings in 1 pound

$$\begin{array}{r}
 45900 \\
 6885 \\
 \hline
 \end{array}$$

**Answer** 734400 the same as above.

**EXAM-**

## EXAMPLE 3.

In 24l. 16s. 4d.  $\frac{1}{2}$  how many farthings?

$$\begin{array}{r}
 \text{£. s. d.} \\
 24 \quad 16 \quad 4 \frac{1}{2} \\
 20 \\
 \hline
 496 \text{ shillings} \\
 12 \\
 \hline
 5956 \text{ pence} \\
 4 \\
 \hline
 23826 \text{ farthings}
 \end{array}$$

farthings in 1l. and to the product add the farthings in 16s. 4d.  $\frac{1}{2}$  and the sum will be the number of farthings sought, as appears by the following

## Operation.

$  \begin{array}{r}  \text{£.} \\  24 \\  960 \text{ farthings in 1l.} \\  \hline  1440 \\  216 \\  \hline  23040 \\  786 \\  \hline  23826 \text{ farthings in}  \end{array}  $	}	farthings in	{	$  \begin{array}{r}  \text{£. s. d.} \\  24 \quad - \quad - \\  0 \quad 16 \quad 4 \frac{1}{2} \\  \hline  24 \quad 16 \quad 4 \frac{1}{2}  \end{array}  $	}	$  \begin{array}{r}  \text{s. d.} \\  16 \quad 4 \frac{1}{2} \\  12 \\  \hline  196 \\  4 \\  \hline  786  \end{array}  $
--	---	--------------	---	--	---	---

EXAM-

# Reduction.

141

## EXAMPLE 4.

In 40 guineas how many shillings, pence and farthings?

$$\begin{array}{r}
 40 \\
 21 \text{ s.} = 1 \text{ guinea} \\
 \hline
 40 \\
 80 \\
 \hline
 840 \text{ shillings} \\
 12 \\
 \hline
 10080 \text{ pence} \\
 4 \\
 \hline
 40320 \text{ Farthings}
 \end{array}$$

## EXAMPLE 5.

In 694l. 10s. How many crowns, shillings, groats and pence?

$$\begin{array}{r}
 \text{L. s.} \\
 694 \text{ 10 (or 2 crowns)} \\
 4 \\
 \hline
 2778 \text{ crowns} \\
 5 \\
 \hline
 13890 \text{ shillings} \\
 3 \\
 \hline
 41670 \text{ groats} \\
 4 \\
 \hline
 166680 \text{ pence}
 \end{array}$$

Having worked these examples by *Reduction descending*, I shall next proceed to prove them by *Reduction ascending* or *Division*.

Exam-

## EXAMPLE 6.

In 960 farthings, how many halfpence, pence, three-pences, six-pences, shillings, and pounds?

$$\begin{array}{r}
 2) \ 960 \\
 \hline
 2) \ 480 \text{ halfpence} \\
 \hline
 3) \ 240 \text{ pence} \\
 \hline
 2) \ 80 \text{ three-pen.} \\
 \hline
 2) \ 40 \text{ six-pences} \\
 \hline
 2|0) \ 2|0 \text{ shillings} \\
 \hline
 \text{£ } 1 \\
 \hline
 \end{array}$$

## EXAMPLE 7.

How many pounds are there in 734400 farthings?

$$\begin{array}{r}
 4) \ 734400 \\
 \hline
 12) \ 183600 \text{ pence} \\
 \hline
 2|0) \ 1530|0 \text{ shill.} \\
 \hline
 \text{Answ. } 765 \text{ pounds} \\
 \hline
 \end{array}$$

## EXAMPLE 8.

In 23825 farthings how many pounds?

$$\begin{array}{r}
 4) \ 23825 \\
 \hline
 12) \ 5956 \frac{1}{2} \\
 \hline
 2|0) \ 49|6 \text{ 4d.} \\
 \hline
 \end{array}$$

Answer £. 24 16s. 4d.  $\frac{1}{2}$

EXAM-

EXAMPLE 9.

In 40320 farthings how many guineas?

$$\begin{array}{r} 4) \ 40320 \\ \hline \end{array}$$

$$\begin{array}{r} 12) \ 10080 \\ \hline \end{array}$$

$$\begin{array}{r} 21) \ 840 \text{ (40 Anf.} \\ \quad 84 \\ \hline \end{array}$$

0

EXAMPLE 10.

In 166680 pence, how many groats, shillings, crowns and pounds?

$$\begin{array}{r} 4) \ 166680 \\ \hline \end{array}$$

$$\begin{array}{r} 3) \ 41670 \text{ groats} \\ \hline \end{array}$$

$$\begin{array}{r} 5) \ 13890 \text{ shillings} \\ \hline \end{array}$$

$$\begin{array}{r} 4) \ 2778 \text{ crowns} \\ \hline \end{array}$$

$$\begin{array}{r} 694 \ 2 - \text{crowns} = \text{£}694 \ 10\text{s.} \\ \hline \end{array}$$

*Note.* These 5 last operations prove all the 5 first examples by beginning with the lowest denomination, and dividing by the numbers they were multiplied by.

EXAMPLE

## EXAMPLE. II.

*Dick's* Uncle being dead to his coffer he went,  
 To search for the treasure, it was his intent.  
 Unlocking the coffer he presently found,  
 The sum he had left him was two hundred pound,  
*Dick* smiles on the hoard, as he's counting his chink,  
 And calls to *Ned Trotter* to bring him some drink.  
*Ned* runs to the cellar and fetches a quart  
 Of humming strong liquor to cherish his heart.  
*Dick* drinks and carouses resolv'd to look big,  
 And roaring sings *Roger de Calveley's Figg*,  
 The sight of his treasure enliven'd his soul,  
 And made him cry out for a full flowing bowl,  
 Three fourths of the number of pounds in the chest,  
 Were good golden guineas and as to the rest,  
 They were all half crown pieces, which pleased *Dick*

(well,

What number of each, with much ease you may tell,  
*Dick* fills all his pockets, resolv'd to look smart,  
 And no longer trudge after the plough or the cart,  
 But wear a big wig and forget what is past,  
 O'er his pipe and his bottle he'll take his repast, }  
 As long as his old Uncle's money will last.

First for  $\frac{3}{4}$  of 200/. Multiply that sum by 3 and  
 divide the product by 4 ; or divide 200 by 4, and  
 multiply the quotient by 3. and we have 150 guineas.  
 thus.

200	4) 200	then 150
3	—	21
—	50	—
4) 600	3	150
—	—	300
150 guineas	150 guineas	—
—	—	3150 shill.

1st i. e.  $\frac{3}{4}$  of the number 200 were guineas and not  
 pounds.

$$\begin{array}{r}
 \text{£.} \\
 200 \\
 20 \\
 \hline
 \text{From } 4000 \text{ shillings} \\
 \text{Take } 3150 \\
 \hline
 850 \text{ remains} \\
 12 \\
 \hline
 3 \text{ } 0 \text{ ) } 1020 \text{ } 0 \\
 \hline
 \text{Answer } 340 \text{ half crowns}
 \end{array}$$

**EXAMPLE II.**

Suppose 6 ingots each in value 18 guineas, were carried to the mint to be coined into five and three-pences. *Quere* the number?

$$\begin{array}{r}
 \begin{array}{cc} \text{£.} & \text{s.} \end{array} & \begin{array}{cc} \text{s.} & \text{d.} \end{array} \\

**C O R O L L A R Y.**

Having in the preceding Example, sufficiently shewn the method whereby money is changed from one denomination to another, I shall now proceed to Reduction of weights measures &c.

TROY.

TROY WEIGHT.

EXAMPLE 1.

If a Silver Tankard weigh 1 lb. 8 oz. 14 dr, 21 grs. what is the content or weight thereof in grains?

lb. oz. dwt. gr.

1 8 14 21

12

—

20 ounces

20

—

414 penny-weights

24

—

1657

830

—

9957 grains

—

EXAMPLE 2.

In 9957 grains how many penny-weights, ounces, and pounds?

4) 9957

—

6) 2489-1 } grs.

—

210) 414-5 } 21

—

12) 20 14

—

1 8 oz.

—

*Note.* The grains in this example are divided by 4 and 6 (= 24) in order to abbreviate the work, and in all such cases *i. e.* when any divisor consists of such a number that 2 small numbers multiplied

Anf. 1 lb. 8 oz. 14 dwt. 21 grs.

**EXAMPLE 3.**

Suppose a Merchant buys 56 Ingots of Silver each weighing 21 oz. 12 dwt. and sends them to a Silver-smith to be made into tankards, cups, salts and spoons, and of each an equal number, each tankard to weigh 19 oz. 18 dwt. each cup 14 oz.  $\frac{1}{2}$ , each salt 11 oz.  $\frac{1}{4}$ , and each spoon 2 oz. 4 dwt. How many of each sort will they make?

	oz.	dwt.	
	21	12	
	20		
The wt. of each	tank.	19 18	
	cup	14 10	
	salt	11 15	432 pen. w. in 1 In.
	spoon	2 4	56 no. of Ingots
		<hr/>	
		48 7	2592
		20	2160
		<hr/>	
divisor	967	967)	24192 (25
			1934
			<hr/>
			4852
			4835
			<hr/>
			17
			<hr/>

**Answer** 25 of each sort and 17 dwt. over.

multiplied together will produce it, it will be much better to divide by those numbers and proceed with the remainders (if any there be) as directed in *page 118*, wherein are ample directions for that purpose.

**Ans-**

APOTHECARIES WEIGHT.

EXAMPLE 1.

In 12 lb. how many ounces, drams, scruples, and grains?

$$\begin{array}{r}
 \text{lb.} \\
 12 \\
 12 \\
 \hline
 144 \text{ ounces} \\
 8 \\
 \hline

$$\begin{array}{r} \text{half yards in 1 pole } 11 \overline{) 3520} \text{ half yards} \\ \hline \end{array}$$

$$\begin{array}{r} 4 \overline{) 320} \text{ poles} \\ \hline \end{array}$$

$$\begin{array}{r} 8 \overline{) 8} \text{ furlongs} \\ \hline \end{array}$$

$$\begin{array}{r} 1 \text{ mile} \\ \hline \end{array}$$

**EXAMPLE 3.**

The globe of our earth as fam'd *Norwood* has found,  
Is twenty five thousand and twenty miles round,  
A mighty long journey for *Seamen* to take,  
Such as *Dampier* Lord *Anson* or Sir *Francis Drake*,  
And such bold adventurers who sail on the Sea,  
Who thousands of miles must go out of their way,  
What yards feet and inches, and barley corns too  
Will surround the circumference presently shew,

This was a fine question in old *Cocker's* days  
 When the youths of the village contended for bays,  
 By solving such queries, and answering fair,  
 What barley corns reach'd round th' *terraqeous*  
 sphere.

25020 miles

1760 yards in 1 mile

---

1501200

25020 miles

190080 barley corns in 1 mile

---

2001600

22518000

25020

---

Answer 4755801600 the same as before

EXAM-

If it were only  
 required to know  
 the number of  
 barley corns, the  
 answer may be  
 obtained by one  
 multiplication,  
*viz.* by multiply-  
 ing the number of  
 miles by the bar-  
 ley corns in one  
 mile, *see the work.*

## EXAMPLE 4.

Admit the *foremost* wheel of a Coach or other Carriage to be  $3\frac{1}{2}$  yards in circumference and the *hindmost*  $5\frac{1}{2}$  yards how many times will each turn round in 162 miles *viz.* between *London* and *Whit-church* in *Shropshire*.

The half yards in 162 miles divided severally by the number of half yards in the circumference of each wheel quotes the number of times each will run round in that distance, as appears by the following

## Operation.

The circum. of the  $\left\{ \begin{array}{l} \text{lesser} \\ \text{greater} \end{array} \right\}$  wheel is  $\left\{ \begin{array}{l} 7 \\ 11 \end{array} \right\}$  half yards.

162 miles

1760 yards in 1 mile

---

9720

1134

162

---

285120 yards

2

---

7) 570240 half yards in 162 miles

---

81462 -6 *viz.* the lesser wheel will turn  
round 81463 times, wanting  
half a yard.

Then for the greater wheel.  
half yds.

11) 570240

---

51840 times the greater wheel  
will turn round.

## CLOTH MEASURE.

## EXAMPLE 1.

In 7416 yards of cloth,  
how many quarters and  
nails?

$$\begin{array}{r}
 \text{yrds.} \\
 7416 \\
 \underline{4} \\
 29664 \text{ quarters} \\
 \underline{4} \\
 118656 \text{ nails}
 \end{array}$$

## EXAMPLE 2.

In 118656 nails, how  
many quarters and yards?

$$\begin{array}{r}
 4) 118656 \\
 \hline

Answer	3780000	piec.

Question 2. by Mr. Vyse.

Suppose London was built 1108 years before the birth of our SAVIOUR, how many days is it since to Christmas 1769 allowing Julian years of 365 days 6 hours?

To 1108

Add 1769

2877

365

14385

17262

8631

1050105

\* 719 - 6 hours

Ans. 1050824 days and  
— (6 hours

\* 6 hours being quarter of a natural day or 24 hours, therefore divide the given number of years by 4, and the quotient will be days.

4) 2877 ..

719 days  $\frac{1}{4}$  or 6 hou.  
— — over.

---

## The RULE of THREE.

**N**OW to the *Golden Rule* we're come,  
 So Tyro haste and learn a sum;  
 View this extensive Rule of art,  
 And learn proportion in each part,  
 This Rule, this *Golden Rule* of three,  
 Is excellent as you will see.  
 Three numbers given, great or small,  
 It finds a fourth proportional,  
 To comprehend this useful art,  
 The following Rule learn well by heart.

### A General RULE for both DIRECT, and INVERSE PROPORTION.

If any number great or less  
 Requires the same † for to express;  
 Then in *Direct Proportion*, we  
 Bring out an answer speedily;  
 But if a greater number should  
 Require a less than what is told,  
 Or less a greater, than 'tis clear  
*Inverse proportion* must appear.  
 To state your question pray observe  
 You ne'er from truth and reason swerve;  
 Write down your terms, so as to name,  
 The first and third may be the same.  
 The second and fourth exact agree;  
 Your numbers must reduced be

---

† That is, if *more* require *more* or *less* require *less*.  
 To

To what Denominations are  
 The lowest, each to each compare.  
 First in *Direct proportion* you,  
 Must multiply (two numbers true.)  
 The second and third ( of diff'rent name )  
 And by the first divide the same.  
 If your *Proportion* proves *Inverse*  
 And greater sums require a less.  
 Let the two first be multiply'd,  
 And by the third before divide.  
 And you will have an answer clear,  
 As quickly shall be made appear.

### S C H O L I U M.

Before I shew how to work any Questions in this Rule it will be necessary to give the learner the following Instructions; *i, e,* first observe that the first and fourth numbers are called *Extremes*, and the second and third *Means*; the product of the *Extremes* is equal to the product of the *Means*. When the first term gives or requires the second, we ask what does the third term give or require also. If *more* be required it will be best (according to Mr. Emerson's excellent method) to mark the *lesser Extreme*; if *less* be required to mark the *greater Extreme* for a divisor; then multiply the other two numbers together, and divide by this divisor, the quotient is the answer, in the same denomination as the second term. When there are remainders reduce them into lower denominations, and divide by the same divisor.

### EXAMPLE I.

As 4 is to 12, so is 18 to a certain number, or otherwise, as 4 is to 18, so is 12 to the same number, what is that number?

P 3

It

It is very evident that in this Example *more* is required, therefore mark the first extreme with an *Asterism* for a divisor, and proceed as before directed.

$$\begin{array}{rcl}
 \text{1st. As } * 4 : 12 :: 18 & & \text{2d, As } 4 : 18 :: 12 \\
 & \begin{array}{r} 12 \\ \hline 4 \overline{) 216} \\ \hline 54 \\ \hline \end{array} & \begin{array}{r} 12 \\ \hline 4 \overline{) 216} \\ \hline 54 \\ \hline \end{array}
 \end{array}$$

### C O R O L L A R Y.

Now it may be easily prov'd that the product of the two Extremes is equal to the product of the two means for  $4 \times 54 = 12 \times 18 = 216$ .

### LEMMA I.

When the second term can be divided by the first, multiply that quotient into the third term and the product will be the answer.

To prove which take the last Example, 12 divided by 4 = 3. and 3 multiplied by 18 = 54.

### EXAMPLE. 2.

As 6 is to 9, so is 12 to a certain number, what is the number ?

$$* 6 : 9 :: 12$$

$$\begin{array}{r} 9 \\ \hline 6 \overline{) 108} \\ \hline \end{array}$$

Answer 18

LEMMA

LEMMA 2.

When the third term can be divided by the first, multiply that quotient by the second term and the product will be the answer.

For  $12 \div 6 = 2$  and  $2 \times 9 = 18$  as above.

EXAMPLE. 3.

As 24 is to 8, so is 36 to a certain number, *Quere* the number?

$$* 24 : 8 :: 36$$

8

$$24) 288, (12 \text{ Answer}$$

24

48

48

0

LEMMA 3.

When the first term can be divided by the second, and the third term by that quote; the last quotient will be the answer.

For  $24 \div 8 = 3$ , and  $36 \div 3 = 12$  the answer as above.

EXAM-

## EXAMPLE 4.

As 48 is to 84, so is 8 to a certain number, *Quere* the number?

$$* 48 : 84 :: 8$$

$$\begin{array}{r} \text{48) 672 (14 Answer} \\ \underline{48} \\ 192 \\ \underline{192} \\ 0 \\ \underline{\phantom{0}} \end{array}$$

## LEMMA 4.

When the first term can be divided by the third, and the second by that quote, the last quotient will be the answer.

For  $48 \div 8 = 6$ , and  $84 \div 6 = 14$  the answer as above.

## COROLLARY.

Having shewn some excellent rules for ordering *proportional numbers*, I shall next proceed to shew their extensive use in trade, commerce, &c. But first I must observe to my ingenious reader, when any question can be easily wrought out by *Compound Multiplication* or *Division*, it will be more expeditiously done by these rules, as may be seen by the following example.

If

# The Rule of Three.

177

If 1 ounce of Silver cost 5s. 4d.  $\frac{1}{2}$ , what will 132 ounces cost at that rate? Now take the reverse of

First by the Rule of Three, this example which proves

oz. s. d. oz. the work, and say If 132 ounces cost 35l. 9s. 6d. What will 1 ounce cost?

<p>* 1 : 5 4 <math>\frac{1}{2}</math> :: 132</p> <p>12</p> <hr/> <p>64</p> <p>4</p> <hr/> <p>258</p> <p>132</p> <hr/> <p>516</p> <p>774</p> <p>258</p> <hr/> <p>4) 34056</p> <hr/> <p>12) 8514</p> <hr/> <p>210) 7019-6</p> <hr/>	<p>* 132 : 35 9 6 :: 1</p> <p>20</p> <hr/> <p>709</p> <p>12</p> <hr/> <p>132) 8514 (12)</p> <p>792</p> <hr/> <p>594</p> <p>528</p> <hr/> <p>66</p> <p>4</p> <hr/> <p>132) 264 (<math>\frac{1}{2}</math>)</p> <p>264</p> <hr/> <p>0</p>

12

An. 35 9 6 as before

The same example wrought by Compound Division.

£. s. d.

11) 35 9 6

---

12) 3 4 6

---

Answer 5 4  $\frac{1}{2}$  the same as before These

These examples plainly shew the extensive use of *Compound Multiplication* and *Division*, and how much preferable in some cases they are to the *Rule of Three*, by solving questions in a far more concise manner, and therefore it is very necessary for all persons to be thoroughly acquainted with those most useful rules namely *Compound Multiplication* and *Division*.

## EXAMPLE 6.

If 6 yards of cloth cost 30s. What will 78 yards cost?

$$\begin{array}{rcccl} & \text{yds.} & \text{s.} & & \text{yds.} \\ * & 6 & : & 30 & :: 78 \\ & & & & 30 \end{array}$$

$$\begin{array}{r} 6 \overline{) 2340} \\ \underline{\phantom{00}00} \end{array}$$

$$\begin{array}{r} 2 \overline{) 390} \\ \underline{\phantom{00}00} \end{array}$$

$$\pounds 19 \text{ 10s.}$$

## EXPLANATION.

It is very obvious that the demand lies upon 78 which therefore must be the *third number*, and as the *first number* must always be of the same name with the *third*, for that reason 6 must here be the *first number*, and then the other number viz. 30. (which is of the same name with the thing required) will remain and consequently must be the *second* or *middle number*, now the question being thus stated and prepared for working, and as 78 yards will cost more than 6 yards, it is manifest that 6 the *lesser extreme* must be the divisor, then by multiplying the *second* and *third* numbers together, and dividing the product by the *first*

## The Rule of Three.

179

*first number* or *lesser extreme*, the quotient will be 390 shillings = 19l. 10s. whence the answer is 19l. 10s.

### EXAMPLE 7.

If a *Soldier's* pay be 6d. *per* day, what is that a year?

day	d.	days
* 1	:	6 :: 365
		. 6

12) 2190

210) 1812 6

Answ.      £9 2s. 6d.

*Note.* As multiplying or dividing by 1, neither augments the multiplicand, nor decreaseth the dividend, therefore there is no occasion to divide by the first term in this example, it being an unite.

---

*Note.* By reasoning and a little consideration, it may be easily known how to state any question for the *demanding sum* or *quantity* must always be the *third number*, which must be of the same denomination as the *first*, whether money, weights, measures, or whatever else may occur in practice.

EXAM-

*The Rule of Three.*

## EXAMPLE 8.

Admit a gentleman has a 1000*l.* per annum, how much may he expend daily, and lay up at the year's end 315*l.* 12*s.* 6*d.*?

$$\begin{array}{r}

 \hline
 \end{array}$$

EXAMPLE 10.

If four strike  $\frac{1}{4}$  of corn, cost a guinea not more,  
Pray what must I give for one hundred and four?  $\frac{1}{4}$

$$\begin{array}{r} \text{b.} \quad \text{s.} \quad \text{b.} \\ 4 : 21 :: 104 \\ \hline 21 \end{array}$$

$\frac{1}{4}$  Bushels.

$$\begin{array}{r} 104 \\ 208 \\ \hline 4) 2184 \\ \hline 210) 546 \end{array}$$

*Note.* The proof of each example is only varying the operation as before taught in page

177

Answer £. 27 6s. 0d.

EXAMPLE 11.

Suppose a Bankrupt owes 1000l. and has in money, goods, and recoverable debts, 500l. 16s. 9d.  $\frac{3}{4}$ . Now suppose these things delivered to his Creditors, what do they get *per* pound?

$$\begin{array}{r} \text{£.} \quad \text{£.} \quad \text{s.} \quad \text{d.} \quad \text{£.} \\ * 1000 : 500 \quad 16 \quad 9 \quad \frac{3}{4} :: 1 \end{array}$$

$$\begin{array}{r} 20 \\ \hline 10016 \\ 12 \\ \hline 120201 \\ 4 \\ \hline 1000 \overline{) 480807} \end{array}$$

$$4) 480 - 807 \text{ remains}$$

$$12) 120$$

Answer 10 shillings

In this example though there is a large remainder, yet the part of a pound each one is to receive, can be no more than 10 shillings.

Q

## EXAMPLE 12.

A *Drover* came riding a man of good mettle,  
 Amongst the *Welsh mountains* to buy up some *cattle*.  
 When the *Welshmen* espy him they splutter and stare,  
 Saying " Bless you coot measter, come buy our fine  
 ware,

" They're sound wind and limb, and as fat as a pig,

" As plump as a Codlin, as sleek as a snig ;

" By their horns you may see, they're young and  
 all that,

" Come bargain coot measter, you see they are fat."

Now th' *Drover* agrees for a score of their cows,

Which fed in a meadow close by the hay-mows,

For seventy-five guineas, the sum was no more,

What each one was sold for be pleas'd to explore ?

Cows Guineas Cow.

## EXAMPLE 16.

*Addressed to the young Ladies.*

Fair *Sylvia* blooming as the rose in *June*,  
 Oft met young *Damon* in the shady bow'rs,  
 Where warbling songsters chant a joyful tune,  
 To cheer the pair, and bless their happy hours.  
 Oft, very oft, this lovely couple went  
 To pay a visit to the silent grove,  
 And mingle kisses sweet with true content,  
 To seal the vows of constancy and love.  
 But oft embarrass'd were the lovely pair,  
 By a most rigid Father's stern decree,  
 Who wou'd not suffer any suitors there,  
 Sworn foe, to love alike and lenity.  
 Shou'd *Damon* near their ancient Castle come,  
 He ne'er must have admittance to his dear,  
 For th' Father's answer was "she's not at home,  
 " And really Sir, you have no bus'ness here."  
 Such rude behaviour long this couple bore,  
 With much anxiety and fretful pain,  
 'Till they agreed at last to bear no more,  
 But trip to *Scotland* o'er the chequer'd plain.  
 There to be link'd in *Hymen's* sacred ty'e,  
 And crown their wishes by a speedy flight;  
 Favour'd by night fair *Sylvia* forth did fly,  
 With *Damon* her enamour'd hearts delight.  
 Soon in the morn, ere *Phæbus* gilt the West,  
 The Father was informed of the plot,  
 And to pursue the couple thought it best,  
 So in an instant he, on horseback got.  
 Just thirty miles the lovers were before  
 The Father when he first began to ride,  
 Two miles he gain'd of them *per* hour or more,  
 But happily the marriage knot was ty'd  
 Before he did o'ertake the flying pair,  
 The rate they went was seven, miles an hour;  
 How many hours wou'd th' Father be, ye fair,  
 Ere he oertook them now to me explore?

By the question the Father went 9 miles *per* hour for the other's 7, but they were 30 miles before him at the start; whence  $9 - 7 = 2$  miles, which he gain'd *per* hour.

Then say \*  $\begin{array}{ccccc} & \text{miles} & \text{hour} & \text{miles} & \\ 2 & : & 1 & :: & 30 \end{array}$

2) 30

Answer 15 hrs.

Now it may be easily prov'd, that 15 hours was the time the father overtook the lovers in, for  $15 \times 9 = 15 \times 7 + 30 = 135$  the miles rode by both parties.

### EXAMPLE 17.

There is a lea or pasture which will feed 24 head of cattle 9 weeks, how long will it feed 36 head of cattle?

$\begin{array}{ccccc} \text{hd.} & & \text{weeks} & & \text{hd.} \\ 24 & : & 9 & :: & 36 * \end{array}$

9

36) 216 (6 weeks Answer

216

0

It is very evident that this example is in *Reciprocal* or *Inverse Proportion*, for 36 head of cattle will require *less* time to graze the pasture in than 24, therefore 36 the *greater extreme* must be the divisor:

Exam-

# The Rule of Three:

## EXAMPLE 18.

Nine mowers agreed to mow down a mead,  
In ten days their work they complete,  
In how much time less, be pleas'd to express  
Wou'd fifteen men do the same feat.

$$\begin{array}{rclcl}
 \text{m.} & \text{days} & \text{m.} & & \\
 9 & : & 10 & :: & 15 \quad * \\
 & & 9 & & \\
 & & \hline
 15 & 90 & (6 \text{ days} & & \\
 & 90 & & & \\
 & \hline
 \end{array}$$

Now as 9 men  
(by the question)  
requir'd 10 days to  
do the work in,  
and as 15 men can  
do it in 6, there-  
fore they will do it  
in 4 days less, for

6 from 10 and there remains 4 the answer.

## EXAMPLE 19.

If 100l. in 12 months gain 5 Interest, what prin-  
cipal will gain as much in 9 months?

$$\begin{array}{rclcl}
 \text{m.} & \text{l.} & \text{m.} & & \\
 12 & : & 100 & :: & 9 \quad * \\
 & & 12 & & \\
 & & \hline
 & 9 & 1200 & & \\
 & & \hline
 \end{array}$$

Answer £.133 6s. 8d.

## EXAMPLE 20.

A merry young spark, one night in the dark,  
Came to me to borrow a crown;  
Quoth he I will pay, in one year I say.  
The cash to you honestly down.  
His words being true, I beg you will shew,  
In figures as plain as you can,  
How long he must lend, to requite me his friend,  
Twelve shillings, and you are the man.

Question

Question 8. By Mr. Clare.

Suppose the battering Ram of *Vespasian* weighed 100000 pounds, and was moved, let us admit, with such a velocity, by strength of hands, as to pass through 20 feet in one second of time, and this was found sufficient to demolish the walls of *Jerusalem*; with what velocity must a bullet that weighs but 30 pounds be moved, in order to do the same execution?

$$\begin{array}{ccccc} & \text{lb.} & & \text{feet} & \text{lb.} \\ \text{Reciprocally } 100000 & : & 20 & :: & 30 * \end{array}$$

$$\begin{array}{r} 20 \\ \hline 30 \overline{) 200000} \\ \underline{66666 \frac{20}{30}} \end{array} \text{ Answer}$$

Question 9. By Mr. Benjamin Donn, see his Arithmetic page 129.

Suppose that in a room where two men *A* and *B* are sitting there is a fire, from which *A* is three feet, and *B* six feet distant, it is required to find how much hotter it is at *A*'s seat than at *B*'s?

To answer this question it must first be philosophically consider'd and learnt, that the effects or degrees of light heat and attraction, are reciprocally proportional to the squares of their distances, from the center whence they are propagated.

feet	feet
<i>A</i> 's distance 3	<i>B</i> 's distance 6
<u>3</u>	<u>6</u>
The sqr. of <i>A</i> 's dist. 9	The sqr. of <i>B</i> 's dist. 36
<u>9</u>	<u>36</u>

$$\text{Reciprocally } 36 : 1 :: 9 *$$

$$\begin{array}{r} 1 \\ \hline 9 \overline{) 36} \\ \underline{4} \end{array} \text{ Answer}$$

So that it is evident *A*'s place is 4 times as hot as *B*'s.

---

---

## The Double Rule of Three, Or Rule of Five Numbers.

**C**OME *Tyro* haste, as I'm alive,  
You're mounted to the *Rule of Five*,  
Where numbers five are truly given,  
To find a sixth be't odd or even ;  
Push forward then and you will see  
'Tis call'd the *Double Rule of Three*  
Because two statings there may be. }

### R U L E.

Your second term must always be,  
(As in the *single Rule of Three*)  
The same denomination true,  
As what is sought appears to you ;  
Your terms of supposition write,  
Each under each, the first in sight,  
And the demanding terms also,  
You must put down the third in row.  
Now reason as the *Rule of Three*,  
And the divisors you will see,  
Which multiply together, and  
A new divisor there will stand.  
Then th' other numbers multiply,  
Each into each and you'll descry  
Your dividend—so now you may  
An answer find without delay.

EXAM-

EXAMPLE I.

IF 100l. principal in 12 months gain 5l. interest, what will 180l. gain in 8 months?

Place the numbers as *per rule viz.* 5 for the middle term; and put the two terms of supposition 100l. and 12 months under each other in the first place, and then the terms of demand 180l. and 8 months must be put under each other in the third place, thus.

\* 100l. ——— 5l. ——— 180l.

\* 12 mo. ——— 8 mo.

Now find the divisors by using the second term in common for both lines or statings, for (as in the *Single Rule of Three* so here) if the *third term* requires *more* mark the *lesser extreme*, if *less* the *greater* for a divisor, which divisors multiplied together make a new divisor, as appears by the following

Operation.

100l. ——— 5l. ——— 180l.

12 mo ——— 8 mo.

1200	divisor	1440
		5

12|00) 72|00

£6. Answer

S C H O L I U M.

In stating questions in this rule remember that each *supposition* must be of the same name or denomination with its respective *demanding term*, as may be seen in

in the preceding example, wherein the *first supposition* being pounds, the *first demanding term* is pounds also, and the *other supposition* being months, its *opposite demanding term* is of the same name likewise.

## EXAMPLE 2.

If 30 bushels of malt are sufficient for a family of 6 persons 12 months, how many bushels will serve a family of 10 persons 24 months or, two years?

\* 6 per. ——— 30 bush. ——— 10 per.

\* 12 mo. ————— 24 mo.

Having got perfectly well acquainted with the preceding tables, it will be found necessary to get by heart the following

## R U L E.

If th' given price of *one* is found  
 Part of a penny, shilling, pound,  
 Before divide the quantity  
 By such a part whate'er it be.

EXAM-

## EXAMPLES.

$$\begin{array}{r}
 \frac{1}{4} \quad \frac{1}{4} \text{ 1468 lb. of cast iron } \frac{1}{4} \text{ at } \frac{1}{4} \text{ per lb.} \\
 \hline
 1d \quad \frac{1}{12} \quad 367 \\
 \hline
 1s \quad 2|0 \quad 3|0-7d.
 \end{array}$$

£.1-10s.-7d. Ans.

The price being a farthing a pound, the given quantity is consequently so many farthings, & a farthing being  $\frac{1}{4}$  of a penny, and a penny the  $\frac{1}{12}$  of a shilling, and a shilling the  $\frac{1}{20}$  of a pnd. therefore the divisors are 4, 12 and 20.

$$\begin{array}{r}
 \frac{1}{2} \quad \frac{1}{2} \text{ 416 lb. at } \frac{1}{2} \text{ per lb.} \\
 \hline
 1d \quad \frac{1}{12} \quad 208 \\
 \hline
 17s.-4d. \text{ Answer}
 \end{array}$$

In this example the divisors are 2 and 12, because 2 halfpence make a penny, and 12 pence a shilling.

$$\begin{array}{r}
 d. \\
 \frac{1}{8} \quad 512 \text{ yards at } \frac{3}{4} \text{ per } \frac{1}{4} \text{ (yd.)} \\
 \hline
 \frac{3}{4} \quad \frac{1}{2} \quad 64 \\
 \hline
 2|0 \quad 3|2
 \end{array}$$

£.1 12s. Answ.

It is very evident that 512 yards at a shilling a yard come to those many shillings, and 1d.  $\frac{1}{2}$ , being the  $\frac{1}{2}$  of a shilling, and three farthings the  $\frac{1}{2}$  of 1d.  $\frac{1}{2}$  therefore the quantity is divided by 8 and that quotient (or price at 1d.  $\frac{1}{2}$ ) by 2 to obtain the answer.

$$\begin{array}{r}
 1d. \quad \frac{1}{12} \quad 8412 \text{ lb. at } 1d. \text{ per lb.} \\
 \hline
 2|0 \quad 70|1 \\
 \hline
 £35-1s. \text{ Answer}
 \end{array}$$

$$\begin{array}{r}
 1d. \quad \frac{1}{12} \quad 5614 \text{ oz. at } 1d. \frac{1}{4} \text{ per } \frac{1}{4} \\
 \hline
 467-10d. \\
 \frac{1}{4} \quad \frac{1}{4} \quad 116-11 \frac{1}{2} \\
 \hline
 2|0 \quad 58|4-9-\frac{1}{4} \\
 \hline
 £29-4s. 9d. \frac{1}{4} \text{ Ans.}
 \end{array}$$

## EXAMPLES.

d.

 $1\frac{1}{2} \mid \frac{1}{8} 814 \text{ lb. at } 1d. \frac{3}{4} \text{ per lb.}$ 
 $\frac{3}{4} \mid \frac{1}{8} 101-9d.$   
 $16-11\frac{1}{2}$ 
 $2 \mid 11 \mid 8 \ 8 \frac{1}{2}$ 
 $\pounds 5 \ 18s. \ 8d. \frac{1}{2} \text{ Ans.}$ 

Three halfpence being the  $\frac{3}{4}$  of a shilling, therefore 814 the given quantity, (which is esteemed as so many shillings)

is divided by 8, and a farthing being  $\frac{1}{8}$  of  $1d. \frac{1}{2}$ , that quotient (or price at  $1d. \frac{1}{2}$ ) is divided by 6, the sum of which quotients divided by 20 gives the answer.

 $2d. \mid \frac{1}{8} 641 \text{ lb at } 2d. \text{ per lb}$ 
 $2 \mid 10 \mid 6-10d.$ 
 $\pounds 5 \ 6s. \ 10d. \text{ Ans.}$ 
 $2d \mid \frac{1}{8} 868 \text{ oz. at } 2d. \frac{1}{4}$ 
 $\frac{1}{4} \mid \frac{1}{8} 144 \ 8d.$   
 $18 \ 1$ 
 $2 \mid 16 \mid 2 \ 9$ 
 $\pounds 8 \ 2s. \ 9d. \text{ Answ.}$ 

Two-pence being  $\frac{1}{5}$  of a shilling, and a farthing  $\frac{1}{8}$  of two-pence, therefore 868 the given quantity (which is esteemed those many shillings) is divided by 6, and that quotient by 8, which quotients added together and divided by 20 give the Answer.

 $3d. \mid \frac{1}{4} 1416 \text{ yards at } 3d.$ 
 $2 \mid 35 \mid 4$ 
 $\pounds 17 \ 14s. \text{ Answer}$ 
 $3d. \mid \frac{1}{4} 316 \text{ oz. at } 3d. \frac{1}{2} \text{ per (oz.)}$ 
 $\frac{1}{2} \mid \frac{1}{4} 204$   
 $34$ 
 $2 \mid 23 \mid 8$ 
 $\pounds 11 \ 18s. \text{ Answer}$ 

Here 816 the given quantity is divided by 4, the aliquot part that 3d is of a shilling, and that quotient by 6 the aliquot part a half-penny is of 3d. for 6 halfpence make three-pence.

## EXAMPLES.

4d. $\frac{1}{3}$	961 lb. at 4d. per 4d. (lb.)	$\frac{1}{3}$	9160 yards at 5d. $\frac{1}{4}$
2 0	32 0 4d.	1	3053 4d.
	£16 or. 4d. Answ.	$\frac{1}{4}$	763 4
			190 10
4d. $\frac{2}{3}$	5674 at 4d. $\frac{3}{4}$	2 0	400 7 6
$\frac{1}{2}$	1891 4d.		£200 7s. 6d. Anf.
$\frac{1}{4}$	236 5		
$\frac{1}{2}$	118 2 $\frac{1}{2}$	6d. $\frac{1}{2}$	1234 at 6d.
2 0	224 5 11 $\frac{1}{2}$	2 0	61 7
	£112 5 11 $\frac{1}{2}$ Answ.		£30 17s. Answer
In this example at 4d. $\frac{3}{4}$ the divisors are 3, 8 and 2, 4d. being the $\frac{1}{3}$ of a shilling, a halfpenny the $\frac{1}{4}$ of 4d. and a farthing the $\frac{1}{2}$ of a halfpenny.		6	1401 lb. at 6d. $\frac{1}{2}$
			700 6d.
			58 4 $\frac{1}{2}$
		2 0	75 8 10 $\frac{1}{2}$
			£37 18s. 10d. $\frac{1}{2}$
4d. $\frac{1}{3}$	814 ells at 5d. per 6d. (ell.)	$\frac{1}{2}$	124 ells at 7d. per (ell.)
1	271 4d.	1	62
	67 10	$\frac{1}{2}$	10 4d.
2 0	33 9 2	2 0	7 2 4
	£16 19s. 2d. Answ.		£3 12s. 4d. Anf.

## EXAMPLES.

$$\begin{array}{r}
 4d. \quad \frac{1}{3} \quad 846 \text{ at } 7d. \frac{3}{4} \\
 3 \quad \frac{1}{4} \quad \underline{\hspace{1cm}} \\
 \quad \quad 282 \\
 \frac{3}{4} \quad \frac{1}{4} \quad 211 \text{ } 6d. \\
 \quad \quad \underline{\hspace{1cm}} \\
 \quad \quad 52 \text{ } 10 \frac{1}{2} \\
 2|0 \quad \underline{\hspace{1cm}} \\
 \quad 54|6 \text{ } 4 \frac{1}{2} \\
 \quad \underline{\hspace{1cm}} \\
 \quad \pounds 27 \text{ } 6s. \text{ } 4d. \frac{1}{2} \text{ Anf.}
 \end{array}$$

In this example 846 the given quantity is divided by 3 and 4, the aliquot parts for 7d. and three farthings being  $\frac{1}{4}$  of 3d. therefore the quotient of 4 (*viz.* the price at 3d.) is divided by 4, because three farthings is the  $\frac{1}{4}$  of three-pence

$$\begin{array}{r}
 4d. \quad \frac{1}{3} \quad 1464 \text{ at } 8d. \\
 4 \quad \frac{1}{3} \quad \underline{\hspace{1cm}} \\
 \quad \quad 488 \\
 \quad \quad 488 \\
 \quad \quad \underline{\hspace{1cm}} \\
 2|0 \quad \underline{\hspace{1cm}} \\
 \quad 97|6 \\
 \quad \underline{\hspace{1cm}} \\
 \quad \pounds 48 \text{ } 16s. \text{ Anf.}
 \end{array}$$

This example may be very expediti-

ously done, by taking the aliquot part of a pound, 8d. being the  $\frac{1}{20}$ th, so that by cutting off the cypher, and dividing by 3, the whole is done at once, but in this case the quantity is considered as pounds instead of shillings.

$$\begin{array}{r}
 \frac{1}{3} \quad 146|4 \text{ at } 8d. \\
 \underline{\hspace{1cm}} \\
 \pounds 48 \text{ } 16s. \text{ Answ. as} \\
 \quad \quad \text{(before}
 \end{array}$$

$$\begin{array}{r}
 \frac{1}{2} \quad 567 \text{ at } 8d. \frac{1}{4} \\
 \underline{\hspace{1cm}} \\
 \frac{1}{3} \quad 283 \text{ } 6d. \\
 \frac{1}{8} \quad \underline{\hspace{1cm}} \\
 \quad 94 \text{ } 6 \\
 \quad \underline{\hspace{1cm}} \\
 \quad 11 \text{ } 9 \frac{3}{4} \\
 2|0 \quad \underline{\hspace{1cm}} \\
 \quad 38|9 \text{ } 9 \frac{3}{4}
 \end{array}$$

$$\begin{array}{r}
 \pounds 19 \text{ } 9s. \text{ } 9d. \frac{3}{4} \text{ Anf.} \\
 \underline{\hspace{1cm}}
 \end{array}$$

In this last example the divisors are 2, 3 and 8, 6d. being  $\frac{1}{2}$  of a shilling, 2d, the  $\frac{1}{3}$  of 6d, and a farthing the  $\frac{1}{8}$  of 2d.

## EXAMPLES.

$$\begin{array}{r}
 6d. \quad \frac{1}{2} \quad 942 \text{ yards at } 9d. \\
 \hline
 9 \quad \frac{1}{2} \quad 47\frac{1}{2} \\
 235 \text{ } 6d. \\
 \hline
 2 \mid 0 \quad 70 \mid 6 \text{ } 6 \\
 \hline
 \text{£ } 35 \text{ } 6s. \text{ } 6d. \text{ } \text{Answ.}
 \end{array}$$

$6d. \quad \frac{1}{2}$      $876 \text{ at } 9d. \frac{1}{2}$   

---

 $3 \quad \frac{1}{2}$      $438$   
 $\frac{1}{2}$      $219$

**CASE I:**

When the given price is more than a shilling, the given quantity stands for shillings; and for what the price exceeds a shilling or 12 pence, take parts as before; but if the whole price makes an even aliquot part of a pound, then divide by that part, if more convenient.

The following examples will make this clear and easy.

**T**

## EXAMPLES.

<p>3d. <math>\frac{1}{4}</math> 578 yards at 1s. 3d. <math>1\frac{1}{8}</math> <math>\frac{1}{12}</math></p> <p>144 6d. (per yd.)</p> <hr/> <p>2 0 72 2 6</p> <hr/> <p>£36 2s. 6d. Answ.</p>	<p>5671 at 1s. 8d.</p> <hr/> <p>£472 11s. 8d. Ans.</p>
<p>Otherwise thus, by taking the aliquot part of a pound.</p> <p>1 3 <math>\frac{1}{16}</math> 578</p> <hr/> <p>£36 2s. 6d. as before (fore</p>	<p>In this example the divisor is 12, 1s. 8d. being the <math>\frac{1}{12}</math> of a pound.</p>

 627160 \* see p. 217  
 2/0 452/6-8d.  
 £226 6s. 8d. Anf.

Note, after the same manner may any other example be done, when the price consists of such fractional parts as before mentioned.

## CASE 5.

If the price is less than a pound or shilling by any single aliquot part, you may take that aliquot part of the quantity, and subtract it there-from, and the remainder will be the answer.

To illustrate this take the last example but two viz.

$\frac{1}{4}$  516 at 15s.  
 129 subtract  
 £387 Answer

## EXAMPLES.

Again take another example on p. 222 viz.

5s.  $\frac{1}{2}$  876 at 12s. 6d.

s d ~~1000~~

2|6  $\frac{1}{2}$  219

109 10s.

328 10 subtract

£547 10s. Answer

In this last example parts are taken for 7s. 6d. and the sum of the quotes subtracted from the

quantity leaves the answer.

Take the other example viz.

$\frac{1}{8}$  5432 at 10d.

905 4d.

2|0 452|6 8.

£226 6s. 8d. Answer.

Note. After the same manner you may proceed with any other example of this kind.

## C A S E 6.

When the given quantity consists of integers and fractional parts, multiply the price by the number of integers; and divide the odd quantity or fractional part into aliquot parts of the integer, or of each other, which being done add them all up together.

## A TABLE of Aliquot Parts of a C. Weight.

lb.	C. wt.	lb.
56	is $\frac{1}{2}$ X	4
28	— $\frac{1}{4}$ X	$3\frac{1}{2}$
16	— $\frac{1}{7}$ X	2
14	— $\frac{1}{8}$ X	$1\frac{1}{4}$
8	— $\frac{1}{4}$ X	1
7	— $\frac{1}{8}$ X	

Note. Aliquot parts of most other things being easily found, it would be needless to say any thing more in this place, concerning them.

*Practice.*

EXAMPLES.

## EXAMPLES.

S C H O L I U M.

According to the foregoing reasoning and method of calculation, any thing may be done that may occur in *Practice*; and to conclude this excellent compendium of arithmetic called *Practice*, I shall here present my readers with some articles therein, lately received from my generous and worthy friend Mr. *P. Antrobus*, Master of *Middlewich* Grammar School *Cheshire*, they are as follow.

A new easy and concise method of solving any question in *Practice*, whether it relates to weight, measure, or time; by reducing the weight measure or time into money, and finding the price at two shillings, whatever the given price is.

R U L E.

Double the right hand figure of the given number (whose price is sought) for shillings, the rest are pounds. Admit 364 yards of cloth be sold for 2s. per yard; here the right hand figure 4 being doubled is 8, and the remainder 36, I account  $\pounds 36$ , therefore the amount of 364 yards at 2s. per yard, is  $\pounds 36$  8s. Now if one yard cost 2s, a quarter will cost 6d, therefore  $364 \frac{3}{4}$  yards at 2s. per yard, will cost  $\pounds 36$  9s. 6d. and if one quarter cost 6d. then half a quarter will cost 3d, &c. Whence 186 C. 3 qrs. 14 lb. at 2s. per C. will cost  $\pounds 18$  13s. 9d. and in like manner for any other case whether weight measure or time.

Hence when you have converted your weight measure or time into money, multiply the money so converted by half the pounds and shillings reduced into shillings, and take parts of 2s. for the pence &c as before, add all together and you have the answer.

But to find more easily the price of any number of pounds at 2s per C account the given pounds as so many farthings, and subtract the 7th, part thereof from the said farthings, the remainder will be the price in farthings.

EXAMPLE.

## EXAMPLE.

What cost 24 lb. at 2s. per C.

$$\begin{array}{r} 7 \overline{) 24} \\ \text{subtract } 3 \frac{3}{7} \\ \hline \end{array}$$

Answer  $20 \frac{3}{7}$  farthings

Thus 256 C. 3 qrs. 24 lb. at 2s. per C. comes to £25 13s. 11d.  $-\frac{3}{7}$

## EXAMPLE 2.

What cost 326 lb. at  $\frac{3}{4}$  per pound?

$$\begin{array}{r|l} 6d. & \frac{1}{4} \overline{) 32} \quad 12 \\ \hline & 8 \quad 3 \\ \hline & 1 \quad - \quad 4 \frac{1}{2} \\ \hline \end{array}$$

Here you see doubling the last figure gives the price at 2s. Then taking any even part of 2s. as here, 6d. is  $\frac{1}{4}$  gives £8 3s. the price at 6d. then  $\frac{3}{4}$  being  $\frac{3}{8}$  of 6d. I take the  $\frac{3}{8}$  thereof and it gives the answer, and so in

the other examples following.

## EXAMPLE 3.

What cost 274 yards at 5d. per yard?

$$\begin{array}{r|l} 4d. & \frac{1}{6} \overline{) 27} \quad 8 \\ \hline 1d. & \frac{1}{4} \overline{) 4 \quad 11 \quad 4} \\ & 1 \quad 2 \quad 10 \\ \hline \end{array}$$

Ans.  $\underline{5 \quad 14 \quad 2}$

## EXAMPLE 4.

What come 36 days wages to at 2s. 2d. per day?  
36 days wages are equal to £3 12s. at 2s. per day.  
 $\frac{1}{12}$  for 2d. is 6

Answer  $\underline{3 \quad 18}$

## EXAMPLE

## EXAMPLE 5.

What cost 171 lb. 2 oz. 18 dwt. at £5 8s. per pound?

lb. oz. dwt.	£. s. d.	£. s.
171 2 18 equal to	17 2 5 $\frac{1}{4}$ $\frac{3}{4}$ at 2s per lb.	5 8
	54	20
	<hr/>	<hr/>
	68 9 11 $-\frac{1}{4}$	2) 108
	856 4 2	<hr/>
	<hr/>	12) 50. 54
Answer	£924 14 1 $\frac{4}{7}$	<hr/>
	<hr/>	2) 10) 12) 4-2
		<hr/>
		6 4 2
		<hr/>

## EXAMPLE 6.

What cost 171 C. 1 qr. 4 lb. at £3 1s. 4d. per C. weight Averdupoise?

C. qr. lb.	£. s. d.
171 1 4 equal to	37 2 6 $\frac{3}{4}$ $\frac{3}{4}$ at 2s. per C.
	<hr/>
	30 $\frac{1}{2}$
	<hr/>
	$  \begin{array}{r}  5+3+7+1-\frac{1}{2}+\frac{6}{7} = 30 \text{ times} \\  8+11+3-\frac{1}{4}+\frac{5}{7} = \frac{1}{2} \text{ of} \\  2+17+1-\frac{1}{7} = \frac{1}{6}  \end{array}  $
	<hr/>
2) 61	
<hr/>	
Ans. 525 5 6 $\frac{1}{4}$ $\frac{1}{7}$	
30 $\frac{1}{2}$ No. of 2s.	
<hr/>	
(in £3 1s.	

7) 20
4) 22 $\frac{6}{7}$
12) 85 $\frac{1}{2}$
2) 0) 7) 7 1
<hr/>
£3 17 1 $\frac{1}{2}$ $\frac{6}{7}$

*Note.* That the learner may not be unacquainted with the method of working these examples, I shall add the following EXPLANATION.

The meaning of this division with the work in the operation is thus performed.

First  $30 \times \frac{3}{4} = 22 \frac{1}{2} = 12 \frac{1}{2}$  farthings, then  $30 \times \frac{3}{4} + 12 = 24 \frac{1}{2}$  farthings  $= 25d. \frac{1}{2}$ , and  $30 \times 6 + 25d. = 175d. = 17s. 1d. \frac{1}{2}$ . Then  $30 \times 2s. = \pounds 3$ , whence we have  $\pounds 3 17s. 1d. \frac{1}{2}$ . Lastly  $17 \times 30 = 510$ , which add to  $\pounds 3 17s. 1d. \frac{1}{2}$  makes  $\pounds 513 17s. 1d. \frac{1}{2}$ , the next line is found by taking  $\frac{1}{4}$  of the price at  $2s.$  for the  $\frac{1}{4}$ , and last of all  $\frac{1}{8}$  of the price of  $2s.$  for the  $4d.$  which sums being all added together make the answer as before.

## EXAMPLE 7.

What is the yearly Rent of 107 acres 2 roods at 45s. per acre?

a. rds.      £.    s.  
107    2 equal to 10    15 at 2s per acre.  
   22  $\frac{1}{2}$  half value

$$\begin{array}{r}
 21 \quad 10 \\
 215 \quad - \quad 2|0) \quad 10|0 \\
 \underline{5 \quad 7 \quad 6} \quad \underline{5} \\
 \text{Answer } \pounds 241 \quad 17 \quad 6
 \end{array}$$

## EXAMPLE 8.

What cost 107 barfels 9 gallons of ale or beer, at 31s. per barrel?

$$\begin{array}{r}
 \text{bar. g.} \quad \pounds. \quad s. \quad d. \quad 2) \quad 21s. \\
 107 \quad 9 = 10 \quad 14 \quad 6 \frac{1}{4} \frac{7}{17} \quad \underline{15 \frac{1}{2}} \\
 \quad \quad \quad 15 \frac{1}{2} \\
 \hline
 53 \quad 12 \quad 7 \frac{3}{4} \frac{1}{17} \quad 17) \quad 70 \\
 107 \quad 5 \quad 3 \frac{1}{2} \frac{2}{17} \quad 4) \quad 14 \frac{2}{17} \\
 \underline{5 \quad 7 \quad 3 \quad \frac{12}{17}} \quad 12) \quad 63 \frac{1}{2} \\
 \text{Answer } \pounds 166 \quad 5 \quad 2 \frac{1}{4} \frac{15}{17} \quad 2|0) \quad 14|5 \quad 3 \\
 \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \underline{7-5-3 \frac{1}{2}}
 \end{array}$$

Note. More examples might be added but these are sufficient to shew the method.

T A R E

## T A R E and T R E T.

**S**IX terms are in this rule combin'd  
 To be observed as you'll find;  
*Gross, Tare, Tret, Suttle, Cloff, Neat-weight,*  
 Which must be us'd to work it right.

1. *Gross*, is the whole weight of any commodity be what it will, with the hogshead, chest &c. that contains it.

2. *Tare* is an allowance made by the *King* to the *Importer*; or by the *Merchant* to the *Buyer* for the weight of the bag, cask, chest, wrapper &c. in which any goods are packed up.—In a book intitl'd *The Book of Rates*, there is a table in which several sorts of goods have their Tares ascertained.

3. *Tret* is an allowance generally made by the *Merchants* of *London* to their *Tradesmen*, &c. for waste and dust in *Tobacco, Spices, Drugs*, &c. being 4 lb. in 104 lb. viz.  $\frac{1}{26}$  part of the whole, after the *Tare* is deducted.

4. *Suttle*, is the weight of the goods when only the *Tare* is taken out, and not the *Tret*.

5. *Cloff* is an allowance made also by the *Citizens* of *London*, for the turn of the scale, viz. 2 lb. for every 3 C. weight, or as some say for 3 C. 1 qr. 8 lb.

6. *Neat-weight* is the weight of any goods, when all allowances are deducted.

First. When the *Neat-weight* of any goods is required, and only *Tare* allowed; observe the following

### R U L E.

From the *Gross weight* deduct the *Tare*,  
 And the *Neat weight* will then appear.

V 2

EXAM-

*Tare and Tret.*

## EXAMPLE 1.

If I buy 114 C. 1 qr. 20 lb. of Tobacco or any other goods, and am allow'd 1 C. 2 qrs. 4 lb. Tare, what is the neat weight?

	C.	qr.	lb.
From the gross	114	1	20
Deduct the tare	1	2	4
	<hr/>		
Remains	112	3	16 neat
	<hr/>		

## EXAMPLE 2.

In 8 bags of hops each weighing gross 3 C. 2 qrs. 15 lb. tare 12 lb. per bag. How much neat weight?

	lb.	C.	qrs.	lb.
Tare per bag	12	3	2	15
Number of bags	8			8
	<hr/>			
28) 96 (3	84	From 29	8	gross
		Take	3	12 tare
		<hr/>		
	12 lb.	Answ. 28	24	
		<hr/>		

## EXAMPLE 3.

In 310 C. 1 qr. 16 lb. gross, tare 16 lb. per C. What is the neat?

lb.	C.	qr.	lb.
16 is 7) 310	1	16	
Tare	44	1	10 $\frac{3}{4}$
	<hr/>		
Answ.	266	1	10 $\frac{3}{4}$
	<hr/>		

*Note.* In dividing by 7 there remains 2 lb. viz. 8 qrs. which being divided by 7, quotes a quarter and 1 remains, and which may be rejected as inconsiderable.

EXAM.

EXAMPLE 4.

What is the neat weight of 4 casks of Raisins, each cask weighing,

C. grs. lb.				
No. 1	2	2	14	} lb. Tare 12 per C. how much neat?
2	3	1	10	
3	2	3	16	
4	1	3	24	
<hr/>				
14 is $\frac{1}{8}$ ) 10 3 8 the whole gross				
<hr/>				
2 is $\frac{1}{7}$ ) 1 1 11 $\frac{1}{2}$				} the tare at $\left\{ \begin{array}{l} 14 \\ 2 \\ \hline 12 \end{array} \right\}$ per C.
Deduct - - 21 $\frac{1}{2}$				
<hr/>				
Remains 1 - 18				
<hr/>				
From the whole gross 10 3 8				
Deduct the tare 1 - 18				
<hr/>				
Remains neat 9 2 18				
<hr/>				

2d. When Tret is allowed with Tare, observe the following

R U L E:

From the whole *Gross* deduct the *Tare*,  
And th' *Suttle weight* will then appear,  
Which weight by *twenty-six* divide;  
The quote's the *Tret*, and then beside  
Deduct it from the *Suttle weight*,  
And the remainder is the *Neat*.

**Tare and Tret.****EXAMPLE I.**

In 12 C. 1 qr. 18 lb. gross, tare 40 lb. tret 4 lb.  
per 104. How much neat weight?

C. qr. lb.

12 1 18

4

—

49

28

—

400

99

—

From the gross 1390

Deduct the tare 40

—

26) 1350 (51 $\frac{3}{4}$  Tret

130

—

50

26

—

24

4

—

26) 96 ( $\frac{3}{4}$

78

—

18

—

**EXAM-**

From Suttle 1350  
Deduct Tret  $51\frac{3}{4}$

28 { 4)  $1298\frac{1}{4}$   
7)  $324\frac{1}{2}$  } lb.  
4)  $46\frac{1}{2}$  } 10

Answer C. 11-2-10  $\frac{1}{4}$

Or thus,

C. qr. lb.

From gross 12 1 18  
Deduct 40 lb. — 1 22  
the tare)

26) 12 — 6 fut.  
Deduct — 1  $23\frac{3}{4}$  tr.

Remains 11 2  $10\frac{1}{4}$  nt.

### EXAMPLE 2.

In 121 C. 2 qr. 4 lb. gross, tare 8 lb. per C. tret 4 lb. per 104. What is the neat weight?

lb. C. qrs. lb.

16 is  $\frac{1}{7}$ ) 121 2 4 gross

8 is  $\frac{1}{2}$ ) 17 1  $12\frac{1}{2}$

From gross deduct 8 2  $20\frac{1}{4}$  } the tare at { 16 } lb.  
3 } per C.

26) 112 3  $11\frac{3}{4}$  futtle  
Deduct 4 1 10 tret

Answer 108 2  $1\frac{3}{4}$  neat

3d. When Cloff is allowed with Tare observe the following

### R. U L E.

Suttle and Tret,—found as before,  
Another Suttle will make more,  
From which deduct the Cloff before,  
And the Neat weight you will procure.

EXAM-

## Tare and Tret.

## EXAMPLE 1.

In 14 C. 2 qrs. 10 lb. gross. tare 2 C. 3 qrs. 14 lb. tret 4 lb. per 104 lb. and cloff 2 lb. for 3 C. What is the neat weight?

From the gross	14	2	10	Cloff is found by multiplying the 2d. futtle by 2, and dividing that product by 3, or divide the 2d. futtle by 3 the quotient will be double pounds in the cloff, or otherwise it may be found by dividing the pounds in the 2d futtle by 168, two pounds being the 168th part of 3 C. weight.
Take the tare	2	3	14	
	<hr/>			
26) Deduct the tret	11	2	24	
	—	1	22½	
	<hr/>			
2d. futtle	11	1	1½	
Deduct the cloff	—	—	7	
	<hr/>			
Remains neat	11	—	22½	
	<hr/>			

C.	C.
11	3) 11
2	—
—	1b. 3½ double lbs. = 7½ as before
3) 22	—
—	
1b. 7½ * Cloff	
—	

Or 1232 the pounds in 11 C. (the 2d. futtle) divided by 168 quotes  $7\frac{56}{168} = 7\frac{1}{3}$  as above.

## EXAMPLE 2.

What is the neat weight of 2 hogheads of tobacco weighing

	C. qrs. lb.	gross { Tare 7 lb. per C. tret 4 lb. per 104, and cloff 2 lb. per C. weight.
No. 1	5 3 10	
2	4 1 12	
	<hr/>	
wh. gross	10 — 22	
	<hr/>	

\* What odd weight remains in finding Cloff is inconsiderable and need not be noticed.

VULGAR

---

---

## VULGAR FRACTIONS.

**F**RACTIONS direct you very clear,  
 When parts of Integers appear;  
 How to proceed, their value find,  
 Tho' e'er so variously combin'd.

### N O T A T I O N.

Any unit or integer, divided into parts is expressed by two numbers thus  $\frac{3}{4}$ , the lower number is called the *denominator*, and the upper the *numerator*, which shews how many parts of the denominator the given fraction consists of. The denominator denotes how many equal parts, any integer or quantity is supposed to be divided into; and is no more than a *divisor* in *simple Division*.

*Fractions* are either *proper*, *improper*, or *compound*.

When the numerator is less than the denominator it expresses a *simple single* or *proper fraction* as  $\frac{1}{2}$ ,  $\frac{3}{4}$ ,  $\frac{6}{9}$ ,  $\frac{12}{20}$  &c.

When the numerator is equal to or greater than the denominator, it denotes an *improper fraction* as  $\frac{5}{3}$ ,  $\frac{6}{3}$ ,  $\frac{12}{4}$ ,  $\frac{164}{91}$  &c.

When several fractions come together, coupled or joined with the particle *of* as  $\frac{2}{3}$  of  $\frac{3}{4}$  of  $\frac{4}{6}$  (*read or verbally express'd thus, two thirds of three fourths of four sixths*) they are *compound fractions* or *fractions of fractions*, and to render this more plain and conspicuous, admit a pound sterling to be divided in this manner.

$$\begin{array}{l}
 \text{6) } \begin{array}{r} \text{s.} \\ 20 \\ \hline \end{array} \begin{array}{r} d \\ 3 \end{array} \begin{array}{r} 4 \\ 4 \end{array} = \frac{1}{8} \\
 \hline \\
 \text{4) } 13 \begin{array}{r} 4 \\ 4 \end{array} = \frac{4}{6} \\
 \hline \\
 \begin{array}{r} 3 \end{array} \begin{array}{r} 4 \\ 3 \end{array} = \frac{1}{4} \\
 \hline \\
 \text{3) } 10 \begin{array}{r} - \\ 4 \end{array} = \frac{3}{4} \\
 \hline \\
 \begin{array}{r} 3 \end{array} \begin{array}{r} 4 \\ 2 \end{array} = \frac{1}{3} \\
 \hline \\
 \begin{array}{r} 6 \end{array} \begin{array}{r} 8 \\ 3 \end{array} = \frac{2}{3} \\
 \hline
 \end{array}$$

$\left. \begin{array}{l} \text{of a } \pounds. \\ \text{of } \frac{1}{6} \text{ of a } \pounds. \\ \text{of } \frac{1}{3} \text{ of } \frac{1}{6} \text{ of a } \pounds. \end{array} \right\}$

A whole number with a fraction annexed, is called a *Mixt number* and is expressed thus  $12 \frac{3}{4}$  viz. 12 units and  $\frac{3}{4}$  of a unit, *i. e.* a unit is broken or divided into 4 parts, and 3 of those parts must be taken to add to the whole number 12,

## Reduction of Vulgar Fractions.

### C A S E I.

To reduce any given fraction to another of equal value.

#### R U L E.

Both terms divide or multiply  
By the same number, you'll espy  
A fraction new,—whose value's even  
Equivalent to what was given.

#### EXAMPLE.

Suppose the fraction be  $\frac{5}{8}$  now according to the rule multiply the given fraction by 6, *i. e.* both numerator and denominator must be multiplied thereby.  
*See the work.*

## 244 *Reduction of Vulgar Fractions.*

$$\begin{array}{r} 5 \quad 8 \\ 6 \quad 6 \\ \hline \end{array}$$

30 48 Whence the new fraction is  $\frac{30}{48} = \frac{5}{8}$ .  
again divide both terms of the new fraction by 6.  
6)  $\frac{30}{48}$  ( $\frac{5}{8}$  the fraction proposed.

### C A S E 2.

*To reduce any whole number into the form of a fraction.*

#### R U L E:

Be the *whole number* great or small,  
Write down a *unit* under all.

This is no more than under any whole number, as 6, 8, 12 &c. to write down a unit, and you have the fractional quantity. As  $\frac{6}{1}$ ,  $\frac{8}{1}$ ,  $\frac{12}{1}$  &c.

### C A S E 3.

*To reduce any whole number to a fraction of a given denomination.*

#### R U L E.

By the denominator you,  
Must multiply your number true;  
Under the product, *Tyro* see,  
That your denominator be.

#### EXAMPLE.

Reduce 12 into a fraction whose denominator shall be 9.

$$\begin{array}{r} 12 \\ 9 \\ \hline \end{array}$$

108 Numerator, then  $\frac{108}{9}$  is the fraction required.

# Reduction of Vulgar Fractions. 245

## C A S E 4.

To reduce a compound fraction to a single-one of the same value.

### R U L E.

Now all the numerators see,  
They multipli'd together be;  
Work the denominators so,  
The single fraction then you'll know.

### EXAMPLES.

Reduce  $\frac{2}{3}$  of  $\frac{3}{4}$  of  $\frac{5}{7}$  to a single or simple fraction.

$\begin{array}{r} 2 \\ 3 \\ \hline 6 \\ 5 \\ \hline 30 \end{array}$	$\begin{array}{r} 3 \\ 4 \\ \hline 12 \\ 7 \\ \hline 84 \end{array}$
---	--

30 N.      84 D. Whence  $\frac{30}{84}$  is the fraction required;

Note, N stands for numerator, and D for denominator.

### C O R O L L A R Y.

The above *compound fraction* may be reduced to a *single one*, by cancelling or rejecting such numerators as are equal to or divisible by any of the denominators; and here it may be observed, that the denominator of the 2d, fraction is divisible by the numerator of the 1st, and the numerator of the 2d, by the denominator of the 1st, then  $2 \times 7 = 14$  D. and 5 is the N. as above, which fraction is equal to  $\frac{30}{14}$  by the rule in page 243

## C A S E 5.

To reduce any mixt number to an improper fraction.

X 3

RULE

## 246 Reduction of Vulgar Fractions.

### R U L E.

By the denominator you  
Must multiply th' whole number true ;  
Unto the product, likewise add  
Your numerator—then is had  
A numerator, new and clear,  
As underneath is made t' appear.

### EXAMPLE.

Reduce  $24\frac{4}{9}$  to an improper fraction.

$$\begin{array}{r} 24\frac{4}{9} \\ 9 \\ \hline \end{array}$$

220 *N.* therefore  $2\frac{20}{9}$  is the fraction required.

*Note.* After the same manner may any *mixt number* be reduced to an *improper fraction*.

### C A S E 6.

To reduce an improper fraction to its equivalent, whole or mixt number.

### R U L E.

Divide the numerator true  
By the denominator, you  
Th' integral part will fairly see,  
And if remainders any be,  
O'er the divisor place the same,  
And you the fractional part may name.

#### EXAMPLE 1.

Reduce  $2\frac{20}{9}$  to its equivalent whole or mixt number.

$$9) 220$$

Answ.  $24\frac{4}{9}$

#### EXAMPLE 2.

Reduce  $7\frac{80}{12}$  to its equivalent whole or mixt number.

$$12) 780$$

Answ. 65

*Note.* This and the five preceding cases are so easy, that any more examples therein wou'd be prolixity only.

C A S E

**C A S E 7.**

*To find the greatest common measure or divisor for the numerator and denominator of any given fraction, or for any two numbers.*

**R U L E.**

The greatest term by th' least divide,  
Th' divisor by what remains beside;  
And thus proceed 'till nought remains,  
The measure's found with little pains.

**EXAMPLE.**

What is the greatest common measure of  $\frac{124}{216}$ ?

$$\begin{array}{r} 124) 216 \text{ (1} \\ 124 \\ \hline \end{array}$$

$$\begin{array}{r} 92) 124 \text{ (1} \\ 92 \\ \hline \end{array}$$

$$\begin{array}{r} 32) 92 \text{ (2} \\ 64 \\ \hline \end{array}$$

$$\begin{array}{r} 28) 32 \text{ (1} \\ 28 \\ \hline \end{array}$$

$$\begin{array}{r} 4) 28 \text{ (7} \\ 28 \\ \hline \end{array}$$

$$\begin{array}{r} 0 \\ \hline \end{array}$$

Answ. 4 is the greatest number or common measure that will divide both numerator and denominator without a remainder.

When there are mixt numbers given, they must be reduced to a common denominator, then proceed with the two new numerators to find their greatest common measure, make that the nu-

merator, and under put the common denominator, which fraction will be the greatest common measure sought or required.

**X 4**

**EXAM-**

## EXAMPLE

What is the greatest common measure of  $7\frac{3}{4}$  and 16?

First, these are to be reduced to a common denominator as before explain'd, thus

$$\begin{array}{r} 30) 64 \text{ (2} \\ \underline{60} \\ 4) 30 \text{ (7} \\ \underline{28} \\ 2) 4 \text{ (2} \\ \underline{4} \end{array} \quad \begin{array}{r} 7\frac{1}{2} \\ 4 \\ \underline{\quad} \\ 30 \text{ N.} \end{array} \quad \begin{array}{r} 16 \\ 4 \\ \underline{\quad} \\ 64 \text{ N.} \end{array} \quad \begin{array}{l} \frac{30}{4} \text{ and } \frac{64}{4} \end{array}$$

Answ.  $\frac{2}{4}$  is the greatest common measure of  $7\frac{3}{4}$  and 16.

## C A S E 8.

To reduce a fraction to its least or lowest terms.

## R U L E.

The *greatest common measure* \* find,  
By which divide both terms combin'd,  
Of any *fraction*,—then most sure,  
The quotients will the terms procure.

## EXAMPLE I.

Reduce  $\frac{204}{228}$  to its least terms.

$$\begin{array}{r} 204) 228 \text{ (1} \\ \underline{204} \end{array}$$

$$\begin{array}{r} 24) 204 \text{ (8} \\ \underline{192} \end{array}$$

$$\begin{array}{r} 12) 24 \text{ (2} \\ \underline{24} \end{array}$$

$$\frac{12}{12}) \frac{204}{228} \text{ (} \frac{17}{19} \text{ Answer}$$

\* If the *common measure* happens to be an unit, the fraction is in its *lowest terms* already. EXAM-

**EXAMPLE 2.**

Reduce  $\frac{1656}{1932}$  to its lowest terms.

1656) 1932 (1

1656

—

276) 1656 (6

1656

—

.

—

$\frac{276}{276}$ )  $\frac{1656}{1932}$  ( $\frac{6}{7}$  Answer

**SCHOLIUM.**

To abbreviate any given fraction which is divisible by any number as 2, 3, 4, 5, 6, 7, &c.—The fraction is easily reduced to its least terms, by dividing both the numerator and denominator by such a number, as evidently appears by the following

**EXAMPLES.**

Reduce  $\frac{44}{112}$  into its least terms.

This fraction halved is  $\frac{22}{56}$  which being also halved is  $\frac{11}{28}$ , and is of equal value to the given fraction  $\frac{44}{112}$ .

Reduce  $\frac{65}{80}$  into its least terms.

This fraction ending with 5 and a cipher is divisible by 5.  $5) \frac{65}{80} (\frac{13}{16}$  Answer

Reduce  $\frac{318}{814}$  into its least terms.

This fraction it is plain is divisible by 2)  $\frac{318}{814} (\frac{159}{407}$

Reduce  $\frac{100}{1400}$  to its least terms.

By cutting off the ciphers the fraction will stand in its lowest terms, thus  $\frac{1}{14}$ .

**CASE 9.**

To reduce fractions of unequal or different denominators to those of equal value with a common denominator.

**RULE**

## R U L E.

The numerator multiply,  
 Of ev'ry fraction that is by,  
 Into th' denominators clear,  
 Except its own, there will appear  
 New numerators,—lastly do,  
 Multiply th' denominators so,  
 Into each other and you'll see  
 A new denominator 'll be.

## EXAMPLE 1.

Reduce  $\frac{2}{3}$ ,  $\frac{3}{4}$ ,  $\frac{6}{12}$  into fractions of one common denominator.

2	3	6	4
9	4	9	9
—	—	—	—
18	12	54	36
12	12	4	12
—	—	—	—
216 N.	144 N.	216 N.	432 D.
—	—	—	—

Whence  $\frac{2}{3} = \frac{2 \times 6}{4 \times 12} = \frac{6}{12}$  and  $\frac{3}{4} = \frac{3 \times 4}{4 \times 12}$ .

## EXAMPLE 2.

Reduce  $14\frac{2}{3}$ , 7 and  $\frac{2}{3}$  of  $\frac{5}{8}$  of  $\frac{3}{9}$  and  $\frac{4}{7}$  to fractions of one common denominator.

First  $14\frac{2}{3} = \frac{44}{3}$ ,  $7 = \frac{7}{1}$ , and the compound fraction  $\frac{2}{3}$  of  $\frac{5}{8}$  of  $\frac{3}{9} = \frac{2 \times 5 \times 3}{3 \times 8 \times 9} = \frac{5}{36}$  in its lowest terms. Then the fractions to be reduced to a common denominator are  $\frac{44}{3}$ ,  $\frac{7}{1}$ ,  $\frac{5}{36}$  and  $\frac{4}{7}$ .

44	7	5	4	3
1	3	1	36	1
<hr/>	<hr/>	<hr/>	<hr/>	<hr/>
44	21	5	144	3
36	36	3	1	36
<hr/>	<hr/>	<hr/>	<hr/>	<hr/>
264	126	15	144	108
132	63	7	3	7
<hr/>	<hr/>	<hr/>	<hr/>	<hr/>
1584	756	105 N.	432 N.	756 Com. denom.
7	7	<hr/>	<hr/>	<hr/>

11088 N. 5292 N.

Answer  $\frac{11088}{756} = \frac{44}{3} = 14\frac{2}{3}$ ,  $\frac{5292}{756} = \frac{7}{1} = 7$ ,  $\frac{108}{756} = \frac{5}{36} = \frac{2}{3}$  of  $\frac{5}{8}$  of  $\frac{3}{9}$ , and  $\frac{432}{756} = \frac{4}{7}$ .

*Note.* It frequently happens that fractions may be reduced to a common denominator, *more easily and in far less terms*, than by the general method of involving the numerator of each fraction into the denominators of all the others, &c. As suppose the fractions  $\frac{3}{50}$  and  $\frac{1}{40}$  were to be reduced to a common denominator, by the general method the common denominator will be 2000 but it is very obvious that by the rule in *page 243* these fractions may be reduced to *such* whose common denominator will be but 200 for  $\frac{3}{50}$  multiplied by 4 and  $\frac{1}{40}$  by 5 produce  $\frac{12}{200}$  and  $\frac{5}{200}$  and which are equivalent or equal in value to  $\frac{1200}{2000}$  and  $\frac{500}{2000}$  the fractions when reduced by the common method.—Again, admit  $\frac{1}{3}$ ,  $\frac{3}{8}$  and  $\frac{5}{12}$  were to be reduced to a common denominator, by the general method the common denominator will be 288 but it may be easily discovered that these fractions may (by the *aforesaid* rule in *page 243*) be reduced to *such* whose common denominator will be but 24 for by multiplying  $\frac{1}{3}$  by 8,  $\frac{3}{8}$  by 3, and  $\frac{5}{12}$  by 2 they will become

## 252      *Reduction of Vulgar Fractions.*

become  $\frac{8}{14}$ ,  $\frac{9}{24}$  and  $\frac{10}{44}$ , and which are equivalent to  $\frac{96}{288}$ ,  $\frac{108}{288}$  and  $\frac{120}{288}$  the fractions when reduced the common way.—And the fractions of the *first example* of *this Case*, viz.  $\frac{2}{4}$ ,  $\frac{3}{8}$  and  $\frac{6}{12}$  being abbreviated become  $\frac{1}{2}$ ,  $\frac{3}{8}$  and  $\frac{1}{2}$  and which by this method may be reduced to *such* whose common denominator will be 8, for the two fractions  $\frac{1}{2}$  and  $\frac{1}{2}$  being severally multiplied by 4, and  $\frac{3}{8}$  by 1 make  $\frac{4}{8}$ ,  $\frac{3}{8}$  and  $\frac{4}{8}$  and which (as may be seen in *page 250*) are equivalent to  $\frac{4}{8}$ ,  $\frac{3}{8}$  and  $\frac{4}{8}$  the fractions when reduced the common way, so that by proceeding after this manner (where the case will admit) a multiplicity of figures and tedious work will be saved.

And here it will be very necessary to acquaint the learner (*what most authors have omitted*) that if one fraction be equivalent to another it will hold, as the numerator of the *one* is to its denominator so is the numerator of the *other* to its denominator, or, as one numerator to the *other* so is one denominator to the *other*. And also the numerator of the *one* multiplied by the denominator of the *other*, will be equal to the denominator of the *one* multiplied by the numerator of the *other*.—And now admit it was required to know whether the last mentioned fraction in the *second example* of *this case* viz.  $\frac{4}{7}$  is equal (as it is there said to be) to  $\frac{432}{756}$ , it certainly is, for 432 multiplied by 7 is equal to 756 multiplied by 4.—Or (by the *common Rule of Three*) as 432 (the numerator of the *one* fraction) is to 756 (its denominator) so is 4 (the numerator of the *other*) to 7 its denominator.—Or as 432 is to 4 so is 756 to 7 the denominator as before. And it is plain that the fraction  $\frac{4}{7}$  is equal to  $\frac{432}{756}$  for as 4 is to 7 so is 432 to 756, so that by any of these methods, it may be easily known whether any one fraction be equivalent to another, without finding their respective values in the known parts of the integer.

C A S E

*CASE 10.*

To reduce coins, weights, measures &c. into fractions.—Suppose 6s. and 4d. were to be reduced to the fraction of a pound *Sterling*. This is no more than to make the pence in 6s. and 4d. the numerator to 240 the pence in a pound.

$$\begin{array}{r} s. \quad d. \\ 6 \quad 4 \\ 12 \\ \hline \end{array}$$

76 N. Then  $\frac{76}{240}$  is the fraction required =  $\frac{19}{60}$  in its lowest terms.

EXAMPLE 2.

Reduce 6d  $\frac{1}{2}$  to the fraction of a shilling.

$$\begin{array}{r} 6 \frac{1}{2} \\ 2 \\ \hline \end{array}$$

13 N. Answ.  $\frac{13}{14}$

EXAMPLE 4.

Reduce 2 R. 14pls. to the fraction of an acre.

2 r. 14 pls.

40

94 N. Answ.  $\frac{94}{160} = \frac{47}{80}$  in its least terms.)

EXAMPLE 3.

Reduce 4C. 1qr. 12lb. to a fraction of 1 C. weight

C. qr. lb.

4 1 12

4

17

28

Answ.  $\frac{488}{138} = \frac{61}{17}$  in its least terms.

138

35

488 N.

Note. After the same manner may any other weights, measures &c. be reduced to fractions.

*CASE 11.*

When fractions are to be reduced to other equivalent ones, of a different integer, i. e. when the given fraction is to be brought from a greater to a less denomination, or from a less to a greater, observe the following

Y

RULE

## R U L E.

If a less denomination's sought,  
 From any greater to be brought,  
 The *numerator* multiply  
 By th' integral parts, you'll soon descry  
 A numerator new and clear,  
 To its denominator there.  
 And when a greater you require,  
 To multiply you must prepare  
 Th' *denominator* by those parts,  
 This do, and master be of arts.

## EXAMPLE 1.

Reduce  $\frac{4}{12}$  £. to an equivalent fraction of a penny.

$$\begin{array}{r} 4 \\ 20 \\ \hline 80 \\ 12 \\ \hline 960 \text{ N.} \end{array}$$

— Answ.  $\frac{960}{12} = \frac{80}{1}$  in its least terms.)

## EXAMPLE 3.

Reduce  $\frac{3}{7}$  lb Troy to the fraction of a pennyweight.

$$\begin{array}{r} 3 \\ 12 \\ \hline 36 \\ 20 \\ \hline 720 \text{ N.} \end{array}$$

— Answ.  $\frac{720}{7}$

## EXAMPLE 2.

Reduce  $\frac{8}{12}$  of a shilling to the fraction of a farthing.

$$\begin{array}{r} 8 \\ 12 \\ \hline 96 \\ 4 \\ \hline 384 \text{ N.} \end{array}$$

— Answ.  $\frac{384}{96} = \frac{4}{1}$

## EXAMPLE 4.

Reduce  $\frac{6}{8}$  of a shilling to the fraction of a pound.

$$\begin{array}{r} 8 \\ 20 \\ \hline 160 \end{array}$$

— Answ.  $\frac{160}{6} = \frac{80}{3}$  in its lowest terms)

EXAM-

EXAMPLE 5.

Reduce  $\frac{18}{160}$  of a farthing, to the fraction of a pound.

$$\begin{array}{r} 160 \\ 4 \\ \hline 640 \end{array} \text{ Answ. } \frac{18}{153600} = \frac{3}{25600} \text{ in its least terms}$$

$$\begin{array}{r} 7680 \\ 20 \\ \hline 153600 \end{array} D.$$

EXAMPLE 6.

Reduce  $\frac{4}{12}$  of  $\frac{1}{16}$  to the fraction of a G. weight.

$$\begin{array}{r} 12 \\ 28 \\ \hline 336 \end{array} \text{ Answ. } \frac{4}{1344} = \frac{1}{336} \text{ in its lowest terms.}$$

Or otherwise by compound fractions.

$$\begin{array}{r} 1344 \\ \hline \end{array} D. \frac{4}{12} \text{ of } \frac{1}{16} \text{ of } \frac{1}{4} = \frac{1}{1344} \text{ as before.}$$

EXAMPLE 7.

Reduce  $\frac{3}{4}$  of a pound to the fraction of a guinea.

$$\begin{array}{r} 3 \\ 20 \\ \hline 60 \end{array} \text{ N. } \begin{array}{r} 4 \\ 21 \\ \hline 84 \end{array} D.$$

Answ.  $\frac{60}{84} = \frac{5}{7}$  in its least terms.

EXAMPLE 8.

Reduce  $\frac{5}{7}$  of a guinea to the fraction of a pound.

$$\begin{array}{r} 5 \\ 21 \\ \hline 105 \end{array} \text{ N. } \begin{array}{r} 7 \\ 20 \\ \hline 140 \end{array} D.$$

Answ.  $\frac{105}{140} = \frac{3}{4}$  in its lowest terms.

C A S E 12.

To find the value of any fraction in money, weight or measure.

R U L E.

The numerator multipl'd  
By th' integer—then next divide  
The product true, be what it will,  
By th' denominator still.  
Th' remainder too, reduce as low.  
As th' lowest terms are pleas'd to go.

Y 2

EXAM-

## EXAMPLE 1.

Required the value of  $\frac{157}{192}$  of a pound *Sterling*.

$$\begin{array}{r} 157 \\ 20 \quad \text{---} \\ 192 \overline{) 3140} \quad (16 \\ 192 \quad \text{---} \\ 1220 \\ 1152 \quad \text{---} \\ 68 \end{array}$$

$$\begin{array}{r} 12 \\ 12 \quad \text{---} \quad d \\ 192 \overline{) 816} \quad (4 \\ 768 \quad \text{---} \\ 48 \\ 4 \quad \text{---} \end{array}$$

$$\begin{array}{r} 192 \overline{) 192} \quad (\frac{1}{2} \\ 192 \quad \text{---} \end{array}$$

Ans. £ — 16s 4d  $\frac{1}{2}$

## EXAMPLE 4.

What is the value of  $\frac{5}{8}$  of 8s 10d?

$$\begin{array}{r} 5 \quad d \\ 8 \quad 10 \\ 5 \quad \text{---} \\ 8 \overline{) 24} \quad 2 \\ 16 \quad \text{---} \\ 8 \quad \text{---} \\ 5 \quad 6d \frac{1}{2} \end{array}$$

## EXAMPLE 2.

What is the value of  $\frac{7}{9}$  of a guinea?

$$\begin{array}{r} 21 \\ 7 \quad \text{---} \\ 9 \overline{) 147} \\ \text{---} \\ \text{Ans. } 16 \quad 4d \end{array}$$

## EXAMPLE 3.

What is the value of  $\frac{4}{9}$  of a pound *Avoirdupois*?

$$\begin{array}{r} 4 \\ 16 \quad \text{---} \\ 9 \overline{) 64} \\ \text{---} \\ 7 \text{ oz. } 1 \text{ dr. } \frac{7}{9} \end{array}$$

## EXAMPLE 5.

What is the value of  $\frac{4}{18}$  of an acre?

$$\begin{array}{r} 4 \\ 4 \quad \text{---} \\ 16 \\ 40 \quad \text{---} \\ 3 \overline{) 640} \\ \text{---} \\ 18 \left\{ \begin{array}{l} 6 \overline{) 213-1} \\ \text{---} \\ 35-3 \end{array} \right\} 10 \\ \text{Ans. } 35 \frac{10}{18} \text{ pls.} = 35 \frac{5}{9} \text{ pls.} \\ \text{After} \end{array}$$

After the same manner may the value of any fraction be found, but there is another method whereby the value may be easily exhibited, which is. (as in page 243) to divide the integer by the denominator, and to multiply that quotient by the numerator: As suppose the value of  $\frac{7}{9}$  of a guinea was required, now 21 shillings (a guinea) being divided by 9, the denominator of the fraction, quotes 2s and 4d (the 9th of a guinea) which being multiplied by the numerator 7, produces 16s and 4d the answer the same as in page 256.

## ADDITION of VULGAR FRACTIONS.

### R U L E.

**T**HE numerators first be sure  
To add, and then you will procure  
A numerator, new and fair,  
Under the same you must take care,  
To write down clear to public view  
Th' common denominator true.

### S C H O L I U M.

In *Addition or Subtraction of Vulgar Fractions* observe, that all *Compound Fractions* must be reduced to *simple ones*, and all to the same integer and denominator, if they are of different denominations.

#### EXAMPLE 1.

What is the sum of  $\frac{5}{8}$   
and  $\frac{7}{8}$ ?  
To 5  
Add 7  
—  
12  
— Answ.  $\frac{12}{8} = \frac{3}{2}$  in  
(its least terms.)

#### EXAMPLE 2.

What is the sum of  $\frac{5}{8}$   
and  $\frac{9}{12}$ ?  
To 5  
Add 9  
—  
13  
— Answ.  $\frac{13}{12} = 1 \frac{1}{12}$   
EXAM-

Y 3

## EXAMPLE 3.

What is the sum of  $\frac{5}{7}$  and  $\frac{6}{7}$ ?

$$\begin{array}{r} 5 \\ 7 \\ \hline 35 \text{ N.} \end{array} \quad \begin{array}{r} 5 \\ 6 \\ 7 \\ \hline 30 \text{ N.} \end{array} \quad \begin{array}{r} 6 \\ 7 \\ \hline 42 \text{ D.} \end{array}$$

Then the fractions to be added are  $\frac{35}{42}$  and  $\frac{30}{42}$  whose sum is  $\frac{65}{42} = 1 \frac{23}{42}$ .

## EXAMPLE 4.

Add  $\frac{1}{2}$ ,  $\frac{3}{4}$  and  $\frac{5}{8}$  together.

These fractions reduced to a common denominator (by the note to case 9 page 251) are  $\frac{40}{80}$ ,  $\frac{60}{80}$  and  $\frac{50}{80}$  which being added together make  $\frac{150}{80} = 1 \frac{17}{16}$  Ans.

## EXAMPLE 5.

What is the sum of  $\frac{3}{4}$  of  $\frac{4}{5}$ ,  $\frac{2}{7}$  and  $1 \frac{1}{4}$ ?

First  $\frac{3}{4}$  of  $\frac{4}{5} = \frac{12}{20} = \frac{3}{5}$  and  $1 \frac{1}{4} = \frac{5}{4}$

Then  $\frac{3}{5}$ ,  $\frac{2}{7}$  and  $\frac{5}{4}$  reduced to a common denominator are  $\frac{84}{140}$ ,  $\frac{40}{140}$  and  $\frac{175}{140}$  whose sum is  $\frac{299}{140} = 1 \frac{119}{140}$ .

## EXAMPLE 6.

Add  $14 \frac{7}{8}$ ,  $23 \frac{1}{4}$  and  $26 \frac{5}{8}$  together.

There are two ways whereby this and such like questions may be done, one whereof is to reduce the mixt numbers to improper fractions, and those to a common denominator. The other is only to reduce the fractional parts of the mixt numbers to fractions of one common denominator, and to add their sum to the whole or integral parts, and which is far more preferable than the first method, by saving a multiplicity of figures as may be seen by the following operations.

## Method 1.

First  $14 \frac{7}{8} = \frac{119}{8}$ ,  $23 \frac{1}{4} = \frac{93}{4}$  and  $26 \frac{5}{8} = \frac{213}{8}$

Then  $\frac{119}{8}$ ,  $\frac{93}{4}$  and  $\frac{213}{8}$  reduced to fractions of a common denominator (by the note to case 9 page 251) are  $\frac{1071}{56}$ ,  $\frac{1674}{56}$  and  $\frac{1917}{56}$  the sum whereof is  $\frac{4662}{56} = 64 \frac{42}{56}$  Answer.

## Method

Method 2.

First, the fractions in this example viz.  $\frac{7}{8}$ ,  $\frac{1}{4}$  and  $\frac{5}{8}$  reduced to fractions of a common denominator (by the Note to Case 9 page 251) are  $\frac{63}{72}$ ,  $\frac{18}{72}$  and  $\frac{40}{72}$  which being added together make  $1\frac{21}{72} = 1\frac{7}{24}$ . Then  $1\frac{7}{24}$  (the sum of the fractions) added to the whole numbers 14, 23 and 26 make  $64\frac{7}{24}$  the answer as before.

EXAMPLE 7.

What is the sum of  $\frac{5}{8}$  of a moidore,  $\frac{5}{8}$  of a pound and  $\frac{7}{8}$  of half a guinea.

First  $\frac{5}{8}$  of a moidore = to the compound fraction  $\frac{5}{8}$  of  $\frac{27}{8} = \frac{135}{64} \text{ £}$ . and  $\frac{7}{8}$  of half a guinea = to the compound fraction  $\frac{7}{8}$  of  $\frac{1}{2}$  of  $\frac{21}{8} = \frac{147}{128} = 1\frac{19}{128} \text{ £}$ . Now these two fractions  $\frac{135}{64}$  and  $1\frac{19}{128}$  have a common denominator, and by multiplying the other viz.  $\frac{5}{8} \text{ £}$  by 20 (see Case 1 page 243) it will have the same denominator (as the other two fractions) by becoming  $\frac{100}{128}$ . Then the fractions to be added are  $\frac{135}{128}$ ,  $1\frac{19}{128}$  and  $\frac{100}{128}$  whose sum is  $2\frac{34}{128} = 2\frac{17}{64} = \text{£}2 \text{ 7s. 4d.}$

EXAMPLE 8.

Admit I sail where billows roar,  
And plow the raging sea,  
And steering to a foreign shore,  
A prize falls in my way;  
When having chang'd a full broad side,  
As Anson us'd to do,  
Or Drake, and many more beside,  
Who boldly dar'd the foe.  
Suppose this prize ten thousand pound,  
Three fiftieths is my share,  
Another Sailor's share is (found  
His part) two eightieths (are)  
I purchase this then what's to me,  
The total worth define,  
And you shall with Minerva be,  
And in her temple shine.

First

First  $\frac{2}{80}$  (the purchased share) =  $\frac{1}{40}$  then  $\frac{3}{50}$  and  $\frac{1}{40}$  reduced to a common denominator (see the *note* to *case 9* page 251) make  $\frac{3}{200}$  and  $\frac{5}{200}$  whose sum is  $\frac{8}{200}$ . And to find the value of  $\frac{8}{200}$  of £10000 (the whole prize) proceed thus

$$\begin{array}{r} 10000 \\ 17 \\ \hline 2|00) 1700|00 \\ \hline \text{Answer } £ 850 \end{array}$$

But this question may be easily answered by finding the value of  $\frac{3}{50}$  and also the value of  $\frac{1}{40}$  of £10000 separately and adding them together,

*See the work.*

$$\begin{array}{r} 4|0) 1000|0 \\ 3 \end{array}$$

$$\begin{array}{r} 5|0) 3000|0 \end{array}$$

To 600 } the { Sailor's own share  
Add 250 } { purchased one

Answer £850 the same as before.

## SUBTRACTION of VULGAR FRACTIONS.

### R U L E:

**A**S in *Addition* first prepare,  
Your fractions with peculiar care,  
Of both the numerators see,  
The difference deducted be,  
And a new numerator then  
Is found—now *Tyro* take your pen,  
And under this before to write,  
Th' common denominator straight.

EXAM-

# Subtraction of Vulgar Fractions. 261

EXAM. 1.	EXAM. 2.	EXAM. 3.	EXAM. 4.
From $\frac{12}{87}$	From $\frac{17}{83}$	From $14\frac{15}{18}$	From $98\frac{15}{17}$
Take $\frac{13}{87}$	Take $\frac{14}{83}$	Take $8\frac{4}{18}$	Take $89\frac{2}{17}$
Ans. $\frac{6}{87}$	Ans. $\frac{3}{83}$	Ans. $6\frac{11}{18}$	Ans. $9\frac{6}{17}$
Proof $\frac{12}{87}$	Proof $\frac{17}{83}$	Proof $14\frac{15}{18}$	Proof $98\frac{15}{17}$

**EXAMPLE 5.** To work this example, say 16 from 15 I cannot, but 27 (the parts the integer is divided into) that I borrow of 15, is 42, 16 from 42 and there remains 26, which set down as a numerator to the denominator 27, and carry 1 to the 8 and proceed as in common subtraction and the answer or remainder will be  $117\frac{26}{27}$  as above.

## EXAMPLE 6.

Subtract  $\frac{4}{10}$  of  $\frac{2}{10}$  from  $\frac{3}{10}$ .  
First  $\frac{4}{10}$  of  $\frac{2}{10} = \frac{2}{10}$  of  $\frac{1}{10}$   
 $= \frac{2}{100}$

Then (by case 1 page 243)  $\frac{3}{10} = \frac{30}{100}$  from which subtract  $\frac{2}{100}$  (the  $\frac{4}{10}$  of  $\frac{2}{10}$ ) and the remainder will be  $\frac{28}{100}$

## EXAMPLE 7.

Subtract  $12\frac{1}{4}$  from  $16\frac{1}{2}$   
First  $12\frac{1}{4} = 12\frac{2}{8}$  and  $16\frac{1}{2} = 16\frac{4}{8}$

Then subtract  $\frac{2}{8}$  from  $\frac{4}{8}$ .

51	49	4
3	4	3
153 N.	196 N.	12 D.

From 196  
Take 153  
Rem. 43

Ans.  $\frac{43}{8} = 5\frac{3}{8}$

Or

Or thus.

First, the fractions in this example viz.  $\frac{3}{4}$  and  $\frac{1}{3}$  reduced to a common denominator are  $\frac{9}{12}$  and  $\frac{4}{12}$  which being added to their respective whole numbers make  $12\frac{9}{12}$  and  $16\frac{4}{12}$  then

$$\begin{array}{r} \text{From } 16\frac{4}{12} \\ \text{Take } 12\frac{9}{12} \\ \hline \end{array}$$

Answ.  $3\frac{7}{12}$  as before.

## MULTIPLICATION of VULGAR FRACTIONS.

A U L E.

**A**LL the numerators multiply  
Together, and you'll soon espy  
Your numerator very clear,  
As quickly will be made t' appear,  
Next the denominators too,  
Thus multipl'd together shew  
The fraction fair, I tell you true.

### EXAMPLE 1.

Multiply  $\frac{3}{5}$  by  $\frac{4}{8}$

$$\begin{array}{r} 3 \quad 4 \\ 5 \quad 8 \\ \hline \end{array}$$

15 N.    32 D.

—    —    Answ.  $\frac{35}{32}$

### EXAMPLE 2.

Multiply  $\frac{4}{8}$  by  $\frac{2}{4}$

First  $\frac{4}{8} = \frac{1}{2}$ , and  $\frac{2}{4} = \frac{1}{2}$

Then the fractions to be multiplied are  $\frac{1}{2}$  and  $\frac{1}{2}$ .

$$\begin{array}{r} 1 \quad 4 \\ 2 \quad 7 \\ \hline \end{array}$$

2 N.    28 D.

—    —    Answ.  $\frac{2}{8} = \frac{1}{4}$

EXAMPLE

# Multiplication of Vulgar Fractions. 263

## EXAMPLE 3.

Multiply  $\frac{6}{7}$  by  $\frac{3}{4}$  of  $\frac{4}{5}$   
 First  $\frac{3}{4}$  of  $\frac{4}{5} = \frac{12}{20} = \frac{3}{5}$   
 Then the fractions to be multiplied are  $\frac{6}{7}$  and  $\frac{3}{5}$ .

$$\begin{array}{r} 6 \quad 7 \\ 3 \quad 5 \\ \hline 18 \text{ N.} \quad 35 \text{ D.} \\ \hline \end{array} \quad \text{Anfw. } \frac{18}{35}.$$

## EXAMPLE 4.

Multiply  $\pounds 5 \frac{3}{8}$  by  $7 \frac{2}{3}$ .  
 First  $5 \frac{3}{8} = 5 \frac{1}{2} = \frac{11}{2}$ ,  
 and  $7 \frac{2}{3} = \frac{23}{3}$

Then, the fractions are  $\frac{11}{2}$  and  $\frac{23}{3}$ .

$$\begin{array}{r} 11 \quad 2 \\ 23 \quad 3 \\ \hline 253 \text{ N.} \quad 6 \text{ D.} \\ \hline \end{array} \quad \text{Anfw. } \frac{253}{6}$$

(=  $\pounds 42 \frac{1}{6} = \pounds 42 \text{ } 3 \text{ } 4 \text{ } d$ )

## EXAMPLE 5.

Multiply  $6 \frac{3}{4}$  by  $\frac{4}{5}$  and that product by 7 and that by  $\frac{2}{3}$  of  $\frac{3}{4}$ .

First  $6 \frac{3}{4} = \frac{27}{4}$ ,  $7 = \frac{7}{1}$  and  $\frac{2}{3}$  of  $\frac{3}{4} = \frac{6}{12} = \frac{1}{2}$ .

Then the example will stand thus, multiply  $\frac{27}{4}$  by  $\frac{4}{5}$  and that product by 7 and that by  $\frac{1}{2}$ .

$$\begin{array}{r} 27 \quad 4 \\ 4 \quad 5 \\ \hline 108 \quad 20 \\ 7 \quad 1 \\ \hline 756 \quad 20 \\ 1 \quad 2 \\ \hline 756 \text{ N.} \quad 40 \text{ D.} \\ \hline \end{array} \quad \text{Anfw, } \frac{756}{40} = \frac{189}{10} = 18 \frac{9}{10}.$$

## DIVISION

# DIVISION of VULGAR FRACTIONS.

## R U L E.

**B**E your divisor what it will  
 And dividend, observe me still;  
 Each numerator multiply,  
 In each denominator by—  
 Crossways and you'll the quotient find,  
 Complete as hereunto's subjoin'd.

## S C H O L I U M.

*Fractions in Division must be prepared by Reduction, the same as in the other rules, i. e. Compound Fractions must be reduced to simple ones, mixt numbers into improper Fractions, whole numbers express'd Fractionwise, &c.*

### EXAMPLE 1.

Divide  $\frac{4}{8}$  by  $\frac{2}{7}$   
 $\frac{2}{7}) \frac{4}{8} (\frac{2^8}{1^6} = 1 \frac{1^2}{1^6} = 1 \frac{3}{4}$   
 Answer.)

### EXAMPLE 3.

Divide  $1\frac{1^6}{1^2}$  by  $\frac{4}{8}$   
 $\frac{4}{8}) 1\frac{1^6}{1^2} (\frac{1^4}{1^4} = \frac{2}{7}$  Answ.

### EXAMPLE 2.

Divide  $\frac{8}{12}$  by  $\frac{3}{8}$   
 $\frac{3}{8}) \frac{8}{12} (\frac{7^2}{3^6} = 2$  Answ.

### EXAMPLE 4.

Divide  $1\frac{2^8}{10^8}$  by  $\frac{7}{12}$   
 $\frac{7}{12}) 1\frac{2^8}{10^8} (\frac{4}{9}$  Answer.

In

In this example, the numerator and denominator of the dividend, are both divisible by their respective terms in the divisor, and therefore bring out the answer as in example 3, and is the same *but in far less terms* than if multiplied cross-wise thus,

4/9)  $\frac{16}{112} \left( \frac{123}{418} \right) = \frac{2}{7}$  as be-  
(fore

### EXAMPLE 7.

**Divide  $12\frac{3}{4}$  by  $\frac{4}{7}$ .**

First  $12 \frac{3}{4} = 5 \frac{1}{4}$

Then  $\frac{4}{7}) \frac{5}{4} = \frac{37}{16} = 22 \frac{5}{16}$  Ans.

### EXAMPLE 9.

**Divide  $\frac{6}{7}$  by 4.**

$$4) \frac{6}{7} \left( \frac{6}{8} = \frac{3}{4} \right)$$

### EXAMPLE II.

Divide  $\frac{3}{4}$  of a pound by  $\frac{2}{3}$  of a shilling.

First  $\frac{2}{3}$  of a shilling =  
 $\frac{1}{3}$  of a pound

Then  $\frac{1}{30} \times \frac{3}{4} \left( \frac{90}{4} = \frac{45}{2} = \right.$   
£.22 10s. AnsW.

### EXAMPLE 5.

Divide  $\frac{3}{4}$  of  $\frac{2}{5}$  by  $\frac{4}{8}$

First  $\frac{3}{4}$  of  $\frac{2}{5} = \frac{6}{20} = \frac{3}{10}$  the dividend.

And  $\frac{4}{8} = \frac{1}{2}$  the divisor

Then  $\frac{1}{2} \cdot \frac{3}{10} \cdot \frac{6}{10} = \frac{3}{5}$  Anf.

### EXAMPLE 6.

Divide  $\frac{1}{2}$  of  $\frac{3}{4}$  by  $\frac{2}{3}$  of  $\frac{6}{8}$ .

First  $\frac{3}{2}$  of  $\frac{3}{4} = \frac{9}{8}$ , and  $\frac{2}{3}$

of  $\frac{6}{8} = \frac{12}{16} = \frac{3}{4}$   
 Then  $\frac{3}{10} \times \frac{3}{8} = \frac{9}{80} = 1 \frac{1}{8}$  Ans.

### EXAMPLE 8.

**Divide  $6\frac{3}{4}$  by  $\frac{3}{4}$  of  $\frac{2}{5}$ .**

First  $6 \frac{3}{4} = \frac{27}{4}$ , and  $\frac{3}{4}$

of  $\frac{2}{5} = \frac{6}{10} = \frac{3}{5}$   
 Then  $\frac{3}{10} \times \frac{27}{4} \left( \frac{270}{12} = \right.$   
 $\frac{3}{6} = 22 \frac{3}{4}$  Answ.

### EXAMPLE 10.

Divide 12 by  $3\frac{4}{5} = 7\frac{1}{5}$

$$\frac{19}{5} \cdot \frac{12}{1} \left( \frac{60}{19} \right) = 3 \frac{3}{19} \text{ Anf.}$$

### EXAMPLE 12.

Divide  $\frac{2}{3}$  of a shilling by  $\frac{3}{4}$  of a pound.

First  $\frac{2}{3}s = \angle \frac{1}{30}$  as before,

Then  $\frac{3}{4} \cdot \frac{1}{30} \left( \frac{4}{90} = \frac{2}{45} \right) =$   
 10d.  $\frac{1}{2} \cdot \frac{10}{15}$

S C H O L I U M :

I shall now proceed to the *Rule of Three*, having given various examples, in *this*, whereby it may be easily observed that *Division of Fractions* is only to reduce

reduce the given fractions (*being simple or improper ones*) to a common denominator, and to make a fraction of the new numerators, (*that of the divisor being made the denominator*) which fraction is the quotient sought, and must be reduced as the nature of the case may require.

## R U L E of T H R E E in V U L G A R F R A C T I O N S.

R U L E.

**P**REPARE your Fractions,—state them free,  
 As in the common Rule of Three;  
 First term's denominator you,  
 By th' numerators of th' other two  
 Must multiply, and then you'll see,  
 A numerator new will be,  
 Th' remaining terms next multiply  
 Th' denominator you'll descry.

### EXAMPLE I.

If  $\frac{2}{3}$  of a pound of tobacco cost 8d.  $\frac{3}{4}$ . How many pounds may be bought for £25?

First  $8d. \frac{3}{4} = \frac{35}{4}$  of  $\frac{1}{12}$   
 of  $\frac{1}{12} = \frac{35}{960}$  and  
 $£25 = \frac{25}{1}$ . Then say

If •  $\frac{£.}{192} : \frac{lb.}{3} :: \frac{£.}{25}$

2	3
25	1
—	—
50	3
192	7
—	—
9600 N.	21 D.
—	—

Ans.  $\frac{9600}{21} = \frac{3200}{7} =$   
 (457  $\frac{1}{7}$  lb.)

Or, reduce the *first* and *third terms* (for the sake of variety) to the fractions of a shilling, and in order to shew that the *Rule of Three in Vulgar Fractions* is exactly the same as the *common one*, (respect being had to the rules in Fractions) multiply the *second* and *third terms* together, divide the product by the *first*, and the quotient will be the answer. See

# Rule of Three in Vulgar Fractions. 267

See the work.

First 8d.  $\frac{3}{4} = \frac{3^5}{4}$  of  $\frac{1}{12} = \frac{3^5}{48} s.$  and £25 =  $\frac{2^5}{1}$  of  $\frac{20}{1} = \frac{500}{1} s.$

Then say If \*  $\frac{3^5}{48} : \frac{2}{3} :: \frac{500}{1} : lb.$   
 $\frac{2}{3} \frac{3^5}{48} \frac{1000}{3} (\frac{8000}{165} = \frac{3200}{7} = 457 \frac{2}{7}$   
 500 1  
 1000 N. 3 D.  
 (Answer as before.)

## EXAMPLE 2.

If  $\frac{2}{3}$  of a C. weight cost £2 6s. 8d. what will  $\frac{6}{7}$  cost?

As \*  $\frac{2}{3} : \frac{6}{7} :: \frac{2 \cdot 6 \cdot 8}{100} : \frac{f. s. d.}{100}$

3 7  
 7 3  
 — —  
 21 21  
 6 2 Ans.  $\frac{2 \cdot 6 \cdot 8}{42} =$   
 — — (£3.  
 126 N. 42 D.

Note. It may very easily be found that £2 6s. 8d. is equal to  $\frac{7}{12}$  for 6s. is  $\frac{6}{12}$  of a £ and 8d. is  $\frac{8}{12}$  of  $\frac{1}{3}$  of a £, which reduced to a simple fraction is  $\frac{8}{48}$ , & by multiplying the other fraction viz.  $\frac{6}{12}$  by 12 (see

Case 1 page 243) it will have the same denominator as  $\frac{8}{48}$  by becoming  $\frac{72}{48}$ , the sum of which two fractions in its lowest terms is  $\frac{1}{3}$ , then £2 6s. 8d. is equal to £2  $\frac{1}{3}$  which being reduced to an improper fraction becomes  $\frac{7}{3}$  as above.—But this may be done more readily by Case 10 page viz. 253 by making 80 the pence in 6s. and 8d. the numerator to 240 the pence in a pound, thus  $\frac{80}{240}$ , and which in its lowest terms will be  $\frac{1}{3}$  to which prefix 2. the whole number, makes £2  $\frac{1}{3}$  equal to the improper fraction  $\frac{7}{3}$  as before.

# 268 Rule of Three in Vulgar Fractions.

## EXAMPLE 3.

If  $\frac{4}{12}$  of a gentleman's estate be worth £400 10s. 6d. what is  $\frac{1}{20}$  of the said estate worth?

First by Reduction  $\frac{4}{12} = \frac{1}{3}$ , £400 10s. 6d. = 400  $\frac{21}{20}$  =  $\frac{16021}{20}$ , and  $\frac{1}{20} = \frac{1}{20}$ .

Then say

$$\text{If } \frac{1}{3} : \frac{16021}{20} :: \frac{1}{20}$$

16021	40	
4	5	
<hr style="width: 50px; margin: 0;"/>	<hr style="width: 50px; margin: 0;"/>	
64084	200	
3	1	
<hr style="width: 50px; margin: 0;"/>	<hr style="width: 50px; margin: 0;"/>	
192252 N.	200 D.	

Answ.  $\frac{192252}{20} = \frac{48063}{5}$

(= £961 5s. 2d.  $\frac{2}{5}$ )

This example may be very elegantly solv'd for ( $\frac{4}{12}$  being equal to  $\frac{1}{3}$  therefore) 3 times £400 10s. 6d. will be the worth of the whole estate, from which deduct  $\frac{1}{3}$  thereof ( $\frac{1}{20}$  being equal to  $\frac{1}{20}$ ) and the remainder will be the answer, see the work.

£.	s.	d.
400	10	6
		3
		<hr style="width: 50px; margin: 0;"/>

5)	1201	11	6	whole estate
Deduct	240	6	3 $\frac{3}{5}$	
			<hr style="width: 50px; margin: 0;"/>	

Answer £961 5 2  $\frac{2}{5}$  as before

## EXAMPLE 4.

Some time ago, as people say,

A debt four men agreed to pay

Of just one pound, each share was fix'd,

One third, one fourth, one fifth, one sixth.

Then Tyro what was each man's due

Of cash to pay? pray tell me true.

The

## Rule of Three in Vulgar Fractions. 269

The fractions in this example viz.  $\frac{1}{3}$ ,  $\frac{1}{4}$ ,  $\frac{1}{5}$ , and  $\frac{1}{6}$ , being reduced to a common denominator and added together, the sum will be (in its lowest terms)  $\frac{19}{60}$ . Then say

$$\begin{array}{l} 1^{st}, \text{ If } * \frac{19}{60} : \frac{20}{1} :: \frac{1}{3} \\ \frac{19}{60}) \frac{20}{1} (4\frac{00}{37} = 7s - d \frac{4}{19} \end{array} \quad \begin{array}{l} 2^{dly}, \text{ If } * \frac{19}{60} : \frac{20}{1} :: \frac{1}{4} \\ \frac{19}{60}) \frac{20}{1} (4\frac{00}{78} = 5s 3d \frac{13}{19} \end{array}$$

$$\begin{array}{l} 3^{dly}, \text{ If } * \frac{19}{60} : \frac{20}{1} :: \frac{1}{5} \\ \frac{19}{60}) \frac{20}{1} (4\frac{00}{90} = 4s 2d \frac{10}{19} \end{array} \quad \begin{array}{l} 4^{thly}, \text{ If } * \frac{19}{60} : \frac{20}{1} :: \frac{1}{6} \\ \frac{19}{60}) \frac{20}{1} (4\frac{00}{114} = 3s 6d \frac{2}{19} \end{array}$$

$$\text{Answer } \left\{ \begin{array}{l} 1^{st}, \\ 2^{d}, \\ 3^{d}, \\ 4^{th}, \end{array} \right\} \text{ man's share } \begin{array}{r} \text{£. s. d.} \\ - 7 - \frac{4}{19} \\ - 5 \quad 3 \frac{13}{19} \\ - 4 \quad 2 \frac{10}{19} \\ - 3 \quad 6 \frac{2}{19} \\ \hline \end{array}$$

Proof £1 - -

*Note.* In these 4 operations the *second* and *third* terms are multiplied together, and the product divided by the *first*.

### EXAMPLE 5.

Suppose I buy  $4\frac{1}{2}$  yards of cloth to make a coat, the cloth being  $1\frac{1}{4}$  yard wide, how many yards of shalloon of  $\frac{3}{4}$  wide will line the same?

*First by Reduction*  $4\frac{1}{2} = \frac{9}{2}$ , and  $1\frac{1}{4} = \frac{5}{4}$ .

*Then as*  $\frac{5}{4} : \frac{9}{2} :: \frac{3}{4} *$

$$\begin{array}{r} 4 \quad 4 \\ 9 \quad 2 \\ \hline 36 \quad 8 \\ 5 \quad 3 \\ \hline 180 \text{ N.} \quad 24 \text{ N.} \end{array}$$

Answer  $\frac{180}{24} = 7\frac{1}{2}$  yards

Or thus

$$\begin{array}{r} 5 \quad 4 \\ 9 \quad 2 \\ \hline 45 \text{ N.} \quad 8 \text{ D. } \frac{3}{4} \text{ } 4\frac{5}{8} \text{ } (\frac{180}{24}) \\ \hline \quad \quad \quad (= 7\frac{1}{2} \text{ as before.}) \end{array}$$

Z 3

EXAMPLE

## 270 Rule of Three in Vulgar Fractions.

### EXAMPLE 6.

Admit 8 men do a certain piece of work in  $16\frac{3}{4}$  days. How long will 24 men be in doing the same?

As  $\frac{8}{1} : 16\frac{3}{4} = \frac{67}{4} :: \frac{24}{1}$

Or thus

$$\begin{array}{r} 1 \\ 67 \\ \hline 67 \\ 8 \\ \hline 536 \text{ N.} \end{array} \quad \begin{array}{r} 1 \\ 4 \\ \hline 4 \\ 24 \\ \hline 96 \text{ D.} \end{array}$$

Answer  $5\frac{36}{96} = 5\frac{7}{12}$  days

$$\begin{array}{r} 67 \\ 8 \\ \hline 536 \text{ N.} \end{array} \quad \begin{array}{r} 1 \\ 4 \\ \hline 4 \text{ D.} \end{array}$$

$\frac{24}{1}) 536 (\frac{536}{96} = 5\frac{7}{12}$  days  
(as before.)

*Note.* These two last questions are in *Reciprocal Proportion*, as appears by the work.

## DOUBLE RULE of THREE, or Rule of FIVE in VULGAR FRACTIONS.

### R U L E.

**Y**OUR Question stated, next proceed  
To multiply your terms with speed,  
First the three last, that product you  
By th' reciprocals of the other two  
Must multiply—the answer fair,  
Will for inspection then appear.

### EXAMPLE 1.

If 12 men are hired to do a piece of work in 8 days at 2s. 2d. per day, what will be the wages of 9 men for  $20\frac{1}{2}$  days?

*First*

## Double Rule of Three in Vulgar Fractions. 271

First by Reduction the numbers expressed in fractions are  $\frac{1}{7}$ ,  $\frac{8}{1}$ , 12 men at 2s 2d per Day = £1 6s = £1  $\frac{6}{10}$  = 1  $\frac{3}{5}$  =  $\frac{13}{5}$ ,  $\frac{9}{1}$  and  $\frac{4}{2}$ .

	m.	m.
	* $\frac{1}{7}$	* $\frac{13}{5}$
	* $\frac{8}{1}$	* $\frac{4}{2}$
9	2	
41	10	
369	20	
13	12	
1107	240	
369	8	
4797 N.	1920 D.	

In this example the multiplying by 1 is omitted for the reason given in page 179.

Ans.  $\frac{4797}{1920} = £2\ 9s\ 11d\ \frac{5}{8}$

### EXAMPLE 2.

What principal will gain £40 in 8 months at 5 per Cent per annum?

First by Reduction 8 months =  $\frac{8}{12}$  =  $\frac{2}{3}$  of a year

Then as \*  $\frac{5}{100} : 100 :: \frac{2}{3} : 40$

100	5
40	2
4000	10 D.
3	—
12000 N.	

Ans.  $\frac{12000}{100} = £1200$

Or by two statings thus,

\*  $\frac{5}{100} : 100 :: \frac{2}{3} : 40$

100
40
5) 4000
£ 800

$\frac{1}{100} : 100 :: \frac{2}{3} : 40$   
 $\frac{2}{3}) 800 (\frac{2400}{3} = £1200$   
as before.

Note. This last stating is in Reciprocal Proportion.  
**EXAM-**

## 272 Double Rule of Three in Vulgar Fractions.

### EXAMPLE 3.

If 12 men spend £20 in 9 months, how much will serve 16 men 18 months?

First by Reduction 9 months =  $\frac{9}{12} = \frac{3}{4}$  of a year, and 18 months =  $1 \frac{1}{2}$  year =  $\frac{3}{2}$ . Then

men	
As *	$\frac{12}{1} \frac{20}{1} \frac{16}{1}$
	$\frac{3}{4} \frac{3}{2}$
20	2
16	12
—	—
320	24
3	3
—	—
960	72 D.
4	—
—	—
3840 N.	

Answer  $\frac{3840}{72} = \frac{160}{3}$   
£53 6s 8d

### SCHOLIUM.

Having so copiously elucidated every difficulty that can possibly occur in *Vulgar Fractions*, I shall now present my readers with two *useful and curious articles* therein, sent me by the *truly ingenious* Mr. Nathaniel Brownell teacher of the Mathematics in *Coventry Warwickshire*.

## Curious Articles in VULGAR FRACTIONS.

### ARTICLE I.

**T**O express the proportion that any one, two, three or more fractions have one to another in whole numbers.

1. If it be required to know, what proportion the numerator bears to the denominator of any fraction, if it be a compound one, you must reduce it to a single one, and then reduce it to its lowest terms, and the numbers expressing the fraction so reduced, will be

be the numbers sought. But if the fraction given be a single one, whether proper or improper, you have nothing to do but reduce it to its lowest terms, and the new fraction is the answer sought. So if the question was made by a mixt number, first reduce it to an improper fraction, in its lowest terms, and the numerator and denominator so reduced is the answer.

2. If the given fractions have a common denominator, then the numerators are the whole numbers that express the proportion, and if they can be reduced lower, you may do it as in the following example.

**EXAMPLE 1.**

What are the whole numbers that express the proportion of  $\frac{3}{7}$  to  $\frac{6}{7}$ ?

Here rejecting the common denominator, the answer will be 3 and 6, *i. e.* the two given fractions will have the same proportion to one another, as the whole numbers 3 and 6 have to one another, and as 3 and 6 may be divided by 3, the quotients 1 and 2, will shew the proportion to be as 1 is to 2.

3. If the given fractions have not a common denominator, then reduce them to fractions that have a common denominator, and work as above.

**EXAMPLE 2.**

What proportion have  $\frac{2}{3}$  to  $\frac{1}{5}$ ?

The fractions when reduced to a common denominator will be  $\frac{10}{15}$ , and  $\frac{3}{15}$ , so that their proportion is as 10 to 3, which are numbers prime to one another, because they cannot be reduced any lower, or have no other common divisor but unity.

**EXAMPLE 3.**

What proportion is between  $\frac{2}{3}$  of  $\frac{5}{8}$  of  $\frac{9}{13}$ ?

*Answer.* The numerator is to the denominator, as 5 to 13, for having reduced the compound fraction to

## 274 Curious Articles in Vulgar Fractions.

to a simple one, it comes to  $\frac{90}{131}$ ; which reduced to its lowest terms becomes  $\frac{5}{13}$ , so that the whole numbers 5 and 13, are the whole numbers that express their true proportion in the lowest terms.

### EXAMPLE 4.

Express the proportion of  $\frac{8}{18}$  in its lowest terms, in whole numbers.

$\frac{8}{18}$  abbreviated becomes  $\frac{4}{9}$ ; so that the fraction is as 4 to 9.

### EXAMPLE 5.

What's the proportion of  $\frac{7}{9}$  in whole numbers?

This being a fraction whose numerator is prime to its denominator, the answer in whole numbers is as 7 to 9.

### EXAMPLE 6.

Express in whole numbers the proportion of  $\frac{225}{878}$  to  $\frac{16}{13}$ .—The fractions in their lowest terms become  $\frac{5}{2}$  and  $\frac{13}{8}$  which being reduced to a common denominator, are  $\frac{15}{8}$  and  $\frac{32}{8}$ .

Now rejecting, or throwing away the common denominator, the numerators not admitting of a common divisor, or of being reduced any lower, the said numerators are the numbers sought, viz. the given fractions are in proportion to one another as 16 to 39.—After the same manner you may proceed with 3, 4, 5, or any other number of given fractions.

## A R T I C L E 2.

*It will be convenient and useful in fractions to know*

1. That if the difference between the numerator and denominator be an unit, and the fraction be either proper or improper, you need not to multiply by the numerator at all, but only divide by the denominator; and if the denominator be less than the numerator, add, or otherwise subtract that quotient to, or from the given number, and the sum or difference will be the answer.

2. Or

## Curious Articles in Vulgar Fractions. 275

2. Or if the difference between the numerator and denominator be more than an unit, multiply the given number by the said difference, divide that product by the denominator, and add or subtract the quotient to or from the given number, according as the denominator is bigger or lesser than the numerator, and the sum or difference is the answer.

3. From these two observations it is very evident that, if the divisor *i. e.* the denominator be broken into two parts, as directed in short division, and the aforesaid difference be either an unit bigger, or less than one of those parts, you need not to multiply by the said difference, but only divide first by that part which differeth from the said difference by an unit, and according as the said difference is an unit more, or less than the said part you must add or subtract, that quotient to, or from the given number, then you must divide that sum or remainder by the other part of the denominator, and if the denominator be less than the numerator, add, or otherwise subtract that last quotient to, or from the given number, and the sum, or remainder will be the answer.

4. Or if the difference of the numerator and denominator be an aliquot part of the denominator, there will be no occasion either to multiply by the said difference, or divide by the denominator, but only divide the given number by the denominator of such aliquot part, and so add, or subtract that quotient to, or from the given number, and the sum or remainder is the answer.

What is the  $\frac{4}{5}$  parts of a Ship's cargo worth, the whole being valued at £2713 12s. 8d.?

	£.	s.	d.
5)	2713	12	8
Subtract	542	14	6 $\frac{2}{4}$ $\frac{3}{5}$
Answer	2170	18	1 $\frac{1}{2}$ $\frac{2}{5}$

## 276 Curious Articles in Vulgar Fractions.

### EXAMPLE to Observation the Second.

What's the value of  $\frac{27}{32}$  parts of an estate whose value is £364 16s. 8d.?

$$\begin{array}{r}
 \text{£.} \quad \text{s.} \quad \text{d.} \\
 364 \quad 16 \quad 8 \\
 \hline
 32 \left\{ \begin{array}{l} 4) 1824 \quad 3 \quad 4 \\ \hline 8) 456 \quad - \quad 10 \\ \hline \text{Subtract} \quad 57 \quad - \quad 1 \frac{1}{4} \\ \hline \text{Answ.} \quad 307 \quad 16 \quad 6 \frac{3}{4} \end{array} \right.
 \end{array}$$

Here the difference between the numerator and denominator is 5, therefore I multiply by 5, and divide the product by the denominator 32, and because the numerator is less than the denominator, subtract the quotient from the multiplicand, and the remainder is the answer.

### Or without Multiplitation by the 3d. Observation.

$$\begin{array}{r}
 \text{£.} \quad \text{s.} \quad \text{d.} \\
 4) 364 \quad 16 \quad 8 \\
 \text{Add} \quad 91 \quad 4 \quad 2 \\
 \hline
 8) 456 \quad - \quad 10 \\
 \text{Subtract} \quad 57 \quad - \quad 1 \frac{1}{4} \\
 \hline
 \text{Answ.} \quad 307 \quad 16 \quad 6 \frac{3}{4}
 \end{array}$$

Here because 5, which I should multiply by, is one unit more than 4, one of the aliquot parts of 32, I divide by 4, and add, then I divide the sum by 8 and subtract.

### EXAMPLES to Observation the Fourth.

What is the  $\frac{105}{112}$  part of £51 12s 8d?

$$\begin{array}{r}
 \text{£.} \quad \text{s.} \quad \text{d.} \\
 4) 51 \quad 12 \quad 8 \\
 \hline
 4) 12 \quad 18 \quad 2 \\
 \hline
 \text{Subtract} \quad 3 \quad 4 \quad 6 \frac{1}{2} \\
 \hline
 \text{Answ.} \quad 48 \quad 8 \quad 1 \frac{1}{2}
 \end{array}$$

In this example the difference between the numerator and denominator is 7, which is an aliquot part of the denominator, viz.  $\frac{1}{8}$ th, therefore I divide by 16, and subtract the quotient from the given number, because the denominator is bigger than the numerator, and the remainder is the answer.

More EXAMPLES for Exercise to the preceding Observations.

1. Suppose *A* and *B* buy a parcel of yarn, which cost £486 16s. 4d. *A* to pay  $\frac{5}{8}$  of the price, and *B*  $\frac{3}{8}$  of the price, how much must each pay?

Answer *A* £304 5s. 2d.  $\frac{1}{2}$ , and *B* £182 11s. 1d.  $\frac{1}{2}$ .

2. *A* and *B* bought 74 C. 1 qr 15 lb. of cotton wool, which cost £376 4s. 9d. *A* to have  $\frac{7}{12}$ , and *B*  $\frac{5}{12}$ , how much wool must each man have, and what must each pay?

Answer  $\left\{ \begin{array}{l} A. \\ B. \end{array} \right\}$  must have  $\left\{ \begin{array}{l} 43 \text{ C. } 1 \text{ qr. } 15 \frac{3}{4} \text{ lb.} \\ 30 \text{ C. } 3 \text{ qr. } 27 \frac{1}{4} \text{ lb.} \end{array} \right\}$

And must pay  $\left\{ \begin{array}{l} 219 \text{ £. } 9 \text{ s. } 5 \frac{1}{4} \text{ d.} \\ 156 \text{ £. } 15 \text{ s. } 3 \frac{3}{4} \text{ d.} \end{array} \right\}$

3. Three merchants *A. B. C.* purchased a Ship and cargo, which cost £586 12s. 8d. *A.* was to pay  $\frac{2}{7}$  *B.* to pay  $\frac{3}{7}$ , and *C.* the rest, what must each pay?

Ans. *A.* £234 13s. -d.  $\frac{3}{4} \frac{1}{5}$ , *B.* £219 19s. 9d. and *C.* £131 19s. 10d. -  $\frac{4}{5}$ .

PROMISCUOUS QUESTIONS.

Question 1. By Mr. Thomas Dilworth.

Says Jack to his brother Harry, I can place four threes in such a manner, that they shall make just 34; can you do so?

Solution.

$$\frac{3}{3} = 1 \quad \text{Answer } 33 \frac{2}{3}$$

34

A a

Question

Question 2. From Mr. *Birks's* Arithmetic.

If the Scavenger's rate at  $1d. \frac{1}{2}$  in the pound, comes to  $6s. 7d. \frac{1}{2}$  where they ordinarily assess  $\frac{4}{5}$  of the rent; what will the *King's* tax for that house be, at  $4s.$  the pound, rated at the full rent?

First by Reduction of Vulgar Fractions  $1d. \frac{1}{2} = \text{£} \frac{1}{160}$ ,  
 $6s. 7d. \frac{1}{2} = \frac{1312}{160} = 18 \frac{3}{5} \text{£}$ , and  $4s. = \frac{1}{5} \text{£}$ .

Then say 1st, As \*  $\frac{\text{£}}{160} : \frac{\text{£}}{1} :: \frac{\text{£}}{18 \frac{3}{5}}$

$\frac{1}{160}) \frac{53}{160} (\frac{8480}{160} = 53 \frac{1}{4} \} = \left\{ \frac{4}{5} \right\}$  of the rent

£66  $\frac{1}{4}$  whole rent

2d. A \*  $\frac{1}{1} : \frac{1}{5} :: 66 \frac{1}{4} = 26 \frac{5}{4}$

1	5
265	4
<u>265</u>	<u>4</u>
265 N.	20 D.
<u>      </u>	<u>      </u>

Ans.  $\frac{265}{20} = 13 \frac{5}{4} = \text{£}13 \text{ } 5s.$

Question 3. By Mr. *Randles*, *Ladies Diary* 1752.

A gentleman has an Orchard of fruit trees,  $\frac{1}{2}$  of the trees bearing apples,  $\frac{1}{4}$  pears,  $\frac{1}{8}$  plums, and 50 of them bearing cherries, how many fruit trees in all grow in the said Orchard?

The fractions in this question viz.  $\frac{1}{2}$ ,  $\frac{1}{4}$  and  $\frac{1}{8}$ , reduced to a common denominator (by the note to case 9 page 251) make  $\frac{6}{12}$ ,  $\frac{3}{12}$ , and  $\frac{1}{12}$ , whereby the whole number of trees is divided into 12 equal parts, whereof those that bear apples are 6, pears 3, and plums 2, which added together make  $\frac{11}{12}$ , so that  $\frac{1}{12}$  being all the trees except the cherries, it is evident (*the whole being divided into 12 parts*) that they must be the remaining  $\frac{1}{12}$ , which by the question is equal to 50, then  $\frac{1}{12}$  or the whole must be 12 times 50 = 600 the number

number of trees in the Orchard, and of which  $\frac{6}{12}$  or  $\frac{1}{2}$  bear apples = 300,  $\frac{3}{12}$  or  $\frac{1}{4}$  pears = 150 and  $\frac{2}{12}$  or  $\frac{1}{6}$  plums = 100 so that the number of each sort will be as under *viz.*

Of those that bear	{ Apples	300
	{ Pears	150
	{ Plums	100
	{ Cherries	50

Total number 600 as in the preced-  
— (ing page.

Question 4. By Sir *Isaac Newton*. See his Universal Arithmetic.

Three workmen can do a piece of work in certain times, *viz.* *A* can do it in 3 weeks, *B* can do thrice the work in 8 weeks, and *C* five times in 12 weeks; in what time can they finish it jointly?

It is evident by the question (or may *very easily* be found by the *Rule of Three*) that *A* can do  $\frac{1}{3}$ , *B*  $\frac{3}{8}$  and *C*  $\frac{5}{12}$  of the work in *one week*, which fractions being reduced to a common denominator (see the note to case 9 page 251) make  $\frac{8}{24}$ ,  $\frac{9}{8}$  and  $\frac{10}{24}$  whose sum is  $\frac{27}{24} = \frac{9}{8}$  being the work that they can do when all are working together *one week*, Then

$$\begin{array}{l} \text{work days} \quad \text{work} \\ \text{If } * \frac{9}{8} : \frac{6}{1} :: \frac{1}{1} \\ \frac{9}{8}) \frac{6}{1} (\frac{48}{9} = \frac{16}{3} = 5\frac{1}{3} \text{ days answer} \end{array}$$

The following question was sent me (with some others,) by the ingenious Mr. *Isaac Gumley* of *Countesthorpe* near *Leicester*, and as it seems to be a pretty piece of entertainment for my fair readers, shall give it a place in this book.

Question 5. By Mr. *Isaac Gumley*.

Says *John* a homely country *swain*,  
 To *Nan* the glory of the plain,  
 On whom he'd fix'd his love;  
 Dear *Nancy* name the happy day,  
 When thou wilt give thyself away,  
 And all my doubts remove.

2.

O fav when thou at Church wilt stand,  
 And give to me thy lovely hand,  
 And make me truly blest;  
 My charming maid, O! let me know,  
 When my fond heart with joy shall glow,  
 Which finds but little rest.

3.

Dear *John* says she I love you well,  
 And think you all the swains excel,  
 In beauty and good sense;  
 Then answer me this question pray;  
 And thou wilt find the happy day,  
 When I'll the boon dispense.

4.

One sixth, one fourth, \* when join'd to four,  
 Will give the day, less half a score,  
 The day o'th' month I mean;  
 So now prepare the gloves and ring,  
 And be as happy as a king,  
 And I will be your queen.

5

But *John* has try'd and try'd again,  
 Until he's almost crack'd his brain,  
 Yet cannot find it out;  
 Then help him O ye *swains* of art,  
 To find the day and ease his heart,  
 And banish ev'ry doubt

---

\*  $\frac{1}{6}$ ,  $\frac{1}{4}$  of the day of the month.

Solution.

First the fractions  $\frac{1}{2}$  and  $\frac{1}{4}$  added together make  $\frac{3}{4}$ . Then (it is evident by the question that)  $\frac{3}{4} + 14 = \frac{5}{4}$  or the whole.—Now the following being a self evident AXIOM viz. if from equal things an equal quantity be taken away, the remainders will be equal to each other, therefore by subtracting  $\frac{3}{4}$  from each side of the above equation, it will be  $\frac{1}{4} = 14$ . Then as  $7 : 14 :: 12 : 24$  the answer.

On the twenty-fourth day young Johnny will find,  
The delights of a Fair, who is virtuous and kind.

## DECIMAL FRACTIONS.

JOHN Muller\* as some authors† say,  
Invented first this curious way,

Of

\* Otherwise called *Regiomontanus*.

† *Malcolm, Potter &c.* But Mr. *Ward* seems at an uncertainty who was the first Inventor.

Mr. *Malcolm* in his history of Arithmetic page 18, says that “ *Regiomontanus* about the year 1464, is the first we know who in his *Triangular Tables* divided the Radius into 10,000 parts instead of 60,000; and so tacitly introduced Decimal parts in place of *Sexagesimals*, *Ramus* in his arithmetic written about 1550, (and published by *Lazarus Schonerus* in 1586) uses Decimal periods in car-

A 2 3

“ rying

Of working sums by equal parts,  
 To shine conspicuous in the arts;  
 By *Decimals* all Fractions are,  
 With freedom wrought and made out clear.  
 By easy rules just to your mind,  
 Heights, depths, and distances you find,  
 You traverse by their well known aid,  
 To things sublime—by learning made  
 To soar above, where planets roll,  
 And measure true from pole to pole,  
 Then *Tyro* haste, judicious be,  
 And soon their excellence you'll see.

### Notation of Decimals.

By *Decimals* you are to understand, that the Integer or unit (be what it will) is supposed to be divided into 10 equal parts, and every one of those parts into 10 other equal parts, and so on by a continual subdivision, and are separated distinguished or known from Integers, by a point or dot placed to the left hand of the fractional parts or numbers, (be what they will) without their denominators, for as dividing a number by 10, 100, 1000 &c. is only separating so many of the right-hand figures from the rest, as there are ciphers in the divisor (see page 116) therefore decimal denominators need not be wrote, as easily understood to be *unity* with as many ciphers annexed as are equal to the number of figures, separated or pointed off to the right-hand.

---

“ rying on the extraction of Square and Cube Roots  
 “ to Fractions. The same did our Country-man  
 “ *Bucklaus* before *Ramus*; and *Record* about the  
 “ same time. But the first who wrote an express  
 “ treatise of Decimals, was *Simon Stevinus*, about  
 “ 1582.” Thus

The Fraction

$$\left\{ \begin{array}{r} 74 \\ 10 \\ \hline 6754 \\ 1000 \\ \hline 8514 \\ 1000 \\ \hline 1000 \end{array} \right\}$$

is wrote without its denominator

$$\left\{ \begin{array}{r} 7.4 \\ 67.54 \\ 8.514 \\ .6 \\ .06 \\ .006 \end{array} \right\}$$

and signifies

$$\left\{ \begin{array}{l} 7 \\ 67 \\ 8 \end{array} \right\} \text{ its } \left\{ \begin{array}{l} 4 \text{ tenth} \\ 54 \text{ hundredth} \\ 514 \text{ thousandth} \end{array} \right\} \text{ parts of an unit.}$$

6 tenth  
6 hundredth  
6 thousandth } parts of an unit.

Thus

So that

It is obvious that if a numerator does not consist of as many figure as there are ciphers in its decimal denominator, the defect must be supplied by prefixing a cipher or ciphers to (the left hand of) the numerator, and that every cipher so placed or prefixt, makes the decimal to signify but a tenth part of what it did.

for .006 } is but one tenth part of } .06 But ciphers annexed to the numerator of a decimal and .06 } is but one tenth part of } .6 mal, also supposes a like number to be annexed to the denominator, and therefore multiplies both by the same number, which does not alter the value of the fraction,

Thus

Thus  $\left\{ \begin{array}{l} .8 \\ .80 \\ .800 \end{array} \right\}$  signifies  $\left\{ \begin{array}{l} \frac{8}{10} \\ \frac{80}{100} \\ \frac{800}{1000} \end{array} \right\} = \frac{4}{5}$  Hence it is manifest that ciphers placed to the right hand of a decimal, neither augment nor diminish its value, and therefore may be annexed to, or rejected from, the right hand of decimals at pleasure.

## ADDITION IN DECIMALS.

### R U L E.

**A**S in whole numbers write directly,  
 Your figures down most circumspectly,  
 The units under units place,  
 And point them off with reg'lar grace,  
 Then add them up as taught before,  
 And you'll the sum with ease explore.

## MULTIPLICATION IN DECIMALS.

### R U L E.

**A**S in whole numbers multiply  
 Your factors true continually,  
 Point off what decimals there be,  
 In both the factors, then you'll see,  
 Your product wrought compleat and fair,  
 As quickly will be made t' appear.

---

*Note.* If there be not so many figures in the product as there are decimals in the factors, a cipher or ciphers must be prefixt to supply the defect.

EXAM-

# 286      *Multiplication in Decimals.*

## EXAMPLE 1.

Multiply    141.14  
By            5.46

84684  
56456  
70570

Product 770.6244

## EXAMPLE 2.

Multiply    7.4587  
By            .00876

447522  
522109  
596696

Product .065338212

In example 2 there are 9 places of decimals in the factors, and but 8 figures in the product, therefore a cipher is prefix to supply the defect.

## EXAMPLE 3.

Multiply    54.567  
By            10

Product 544.67

† Hence it is plain that to multiply any decimal fraction or mixt number by an unit with any number of ciphers annexed, is only removing the deci-

mal point so many places farther to the right hand, as there are ciphers in the multiplying factor and subjoining ciphers if need be. So if 78.54 were to be multiplied

By  $\left\{ \begin{array}{l} 10 \\ 100 \\ 1000 \\ 10000 \end{array} \right\}$  the prod. will be  $\left\{ \begin{array}{l} 785.4 \\ 7854. \\ 78540. \\ 785400. \end{array} \right.$

Multiply 75 4678  
By 6.05408

60 | 37424  
3018 | 7120  
37733 | 90  
4528068 | 0

Prod. 456.8880 | 98624\*

\* In this product you see there are 9 places of decimals, but as in most cases 3 or 4 are sufficient, it is therefore very necessary to become acquainted with the following most useful

CON-

CONTRACTION

To multiply any given factors, and have in the product any desired number of Decimal parts less than the whole of such parts.

R U L E.

Under the multiplicand place the multiplier in an inverted order, so that its unit figure (before inverted) may stand under that place of parts in the multiplicand, as you would have the last figure of the product to be, then in multiplying reject all the figures in the multiplicand which are on the right of the figure you are multiplying by, placing the products so, that their right hand figures may fall straight below each other, and carry to such right hand figures from the product of the 2 next rejected multiplicand figures thus, viz. 1 from 5 to 15, 2 from 15 to 25, 3 from 25 to 35, &c. and the sum of the lines will be the product to the number of decimal places required, and will be seldom wrong in the last figure.

EXAMPLE I.

Multiply 75.4678 by 6.05408 so as to retain only 4 places of decimals in the product (see this example worked at large in the preceding page)

Multiplicand	75.4678
Mult. inverted	80450.6
	<hr/>
	4528068
	37734
	3019
	60
	<hr/>
Product	456 8881
	<hr/>

EXAMPLE 2.

Multiply 6.485676  
By 4587.0 so  
as to retain 3 places of  
decimals

Multiplicand	6.485676
Mult. inver.	4587.0
	<hr/>
	4540
	519
	32
	2
	<hr/>
Product	5.093
	<hr/>

## EXAMPLE 7.

Multiply .68479  
By .0765 to  
have 5 places of decimals  
in the product.

$$\begin{array}{r}
 .68479 \\
 \times .0765 \\
 \hline
 342054 \\
 411352 \\
 479300 \\
 481100 \\
 \hline
 .05238
 \end{array}$$

where that author says, they are more curious than useful.

*Note.* As this contraction and that which follows in division are quite practical and facile, and answer the same end as the method of *Recurrents* or *Circulating Decimals* doth, therefore to have treated on them wou'd certainly have been swelling this treatise to no manner of purpose but curiosity only. See page 193 of *Birks's arithmetic*,

## DIVISION IN DECIMALS.

## R U L E.

AS in whole numbers you divide,  
Observe this useful hint beside,  
What decimals your dividend,  
Exceeds th' divisor, then my friend,  
Cut from the quote that number true,  
The decimal appears to you,  
As the annex examples shew.

*Note.* If the quotient does not contain a sufficient number of figures to be pointed off, the defect must be supplied by prefixing cyphers thereto.

EXAMPLE

EXAMPLE 1.

Divide 55.37376 by 4.176.

$$\begin{array}{r}
 4.176 \overline{) 55.37376} \quad (13.26 \\
 \underline{41 \ 76} \\
 13 \ 613 \\
 \underline{12 \ 528} \\
 10 \ 857 \\
 \underline{8 \ 352} \\
 2 \ 5056 \\
 \underline{2 \ 5056} \\
 0
 \end{array}$$

In this example the number of decimal places in the dividend, exceeds those in the divisor by 2, therefore that number of decimals is pointed off in the quotient.

EXAMPLE 2.

Divide 4.68 by 123.45.

$$\begin{array}{r}
 123.45 \overline{) 4.6800} \quad (.03791 \\
 \underline{3 \ 7035} \\
 97650 \\
 \underline{86415} \\
 112350 \\
 \underline{111105} \\
 12450 \\
 \underline{12345} \\
 105
 \end{array}$$

When any dividend contains fewer figures than its divisor, a competent number of ciphers must be annexed after the decimal point in the dividend, to make it contain the divisor some number of times less than 10, and

as you proceed a cipher must be subjoined to each remainder, till the dividend is continued to a sufficient number of decimal places.—In this example the dividend is continued to 7 places of decimals, which being 5 more than those in the divisor, therefore a cipher is prefixt to the quotient as not otherwise containing figures enow to be pointed off, to make it consist of that number of decimals.

**EXAMPLE 3.**

Divide .078246 by .042

 $.042) .078246 \text{ (1.863)}$ 

$$\begin{array}{r}
 42 \\
 \hline
 362 \\
 336 \\
 \hline
 264 \\
 252 \\
 \hline
 126 \\
 126 \\
 \hline
 0 \\
 \hline
 \end{array}$$

**EXAMPLE 4.**

Divide .45674 by 82.

 $82) .45674 \text{ (.00557)}$ 

$$\begin{array}{r}
 410 \\
 \hline
 467 \\
 410 \\
 \hline
 574 \\
 574 \\
 \hline
 0 \\
 \hline
 \end{array}$$

In this example there being 5 places of decimals in the dividend, and none in the divisor, there-

fore 2 ciphers are prefixt to the quotient to make it consist of its proper number of decimal places.

**EXAMPLE 5.**

Divide .75£ by .0125.£

 $.0125) .7500 \text{ (60£)}$ 

$$\begin{array}{r}
 750 \\
 \hline
 .0 \\
 \hline
 \end{array}$$

In this example the number of decimal places in the dividend being (by annexing 2 ciphers) made equal in number to the decimals in the divisor, therefore 60 the quotient is a whole number.—This example is the same as if it were required to divide 15s by 3d, a pound being the Integer, for the decimal

mal of 15s is 75 $\frac{1}{2}$  and that of 3d, .0125 $\frac{1}{2}$  as will be easily known when you understand *Reduction of Decimals*. Hence it is manifest that

As *Multiplication* } of fractions { *decreaseth* their value  
So *Division* } { *increaseth* it, contrary  
in both to the nature of Integers.

EXAMPLE 6.

Divide 987.65 by 100.

100) 987.65

9.8765 Quotient, whereby it is plain that to divide any decimal fraction or mixt number by an unit with a cipher or ciphers annexed, is only removing the decimal point in the dividend so many places farther to the left hand as there are ciphers in the divisor, prefixing ciphers to the dividend if need be.

Thus

$$88.62 \text{ divided by } \left\{ \begin{array}{c} 10 \\ 100 \\ 1000 \\ 10000 \end{array} \right\} \text{ quotes } \left\{ \begin{array}{c} 8.862 \\ .8862 \\ .08862 \\ .008862 \end{array} \right.$$

From what has herein before been said relating to Division it may be easily observed that the first figure of every quotient (as well in Division of Integers as Decimals) must possess the same place (with respect to its value) as that figure of the dividend doth, which stands over the unit's place of the first figure's product and which is an eligible RULE to value quotients obtained by the following useful

CONTRACTION

When the divisor consists of many figures the division at large will be troublesome, but may be much abbreviated by the following

B b 2

RULE

## R U L E.

Reject as many of the right hand figures in the divisor as will make it consist of the same number of figures there is to be in the quotient, observing to carry from such rejected figures as directed in the contraction of Multiplication *page 287* and instead of taking down a figure from the dividend to each remainder, point off a figure each time from the right hand side of the divisor till it be exhausted, but if the divisor does not consist of as many figures as there are to be in the quotient, work with the whole divisor the usual or common way till the defect is supplied, and then proceed as above directed.

## EXAMPLE I.

Divide 423.68946 by 59.6874:

*Contracted Method*

59.6874) 423.68946 (7.0984

.....

417812

In this example one figure is cut off from the divisor, because it contains 1 more than was to be found, and as 3 the units place of the dividend, stands over 7 the units place of the first figure's product, therefore the first figure in the quotient is units.

5877

5372

505

477

28

24

4

*Common Method.*

59.6874) 423.68946 (7.0984

417811|8

5877|660

5371|866

505|7940

477|4992

28|29480

23|87896

24|41584

EXAMPLE

EXAMPLE 2.

Divide 69.7482 by 84.5 so that the quotient may contain 4 decimals.

$$\begin{array}{r}
 84.5 \overline{) 69.7482} \quad (.8254 \\
 \underline{67 \ 60} \\
 21 \ 48 \\
 \underline{16 \ 90} \\
 45 \ 8 \\
 \underline{42 \ 3} \\
 3 \ 5 \\
 \underline{3 \ 4} \\
 1
 \end{array}$$

EXAMPLE 3.

Divide .045768 by .9874

$$\begin{array}{r}
 0.9874 \overline{) .045768} \quad (.04635 \\
 \underline{39496} \\
 6272 \\
 \underline{5924} \\
 348 \\
 \underline{296} \\
 52 \\
 \underline{49} \\
 3
 \end{array}$$

from the dividend, because the divisor contains one figure less than what is required to be in the quotient, and as 7 the *first place of Decimals* in the dividend, stands over 6 the units place of the first figure's product, therefore 8 the first figure in the quotient is in the *first place of Decimals*.—And in the 3d example the *second place of Decimals* in the dividend viz. the figure 4 stands over 3 the units place of the first figure's product, therefore a cipher is prefix to the figure 4 in the quotient, to make it possess the *second place* also.

## REDUCTION IN DECIMALS.

### CASE I.

To reduce any Vulgar Fraction to an equivalent Decimal one.

B b 3

RULE

## R U L E.

**F** I R S T to the numerator add  
Cyphers at pleasure,—then is had  
Your decimal,—if you divide  
By th' denominator true beside.

## EXAMPLE I.

One third of a unit discover to me,  
In decimal parts and with truth to agree.

$$3 \overline{) 1.0000}$$

.3333 &c. *ad infinitum*.

## EXAMPLE 2.

Reduce  $\frac{13}{145}$  to a Decimal.

$$145 \overline{) 13.00} \quad (.089$$

1160

1400

1305

950

870

80

## EXAMPLE 3.

Reduce  $\frac{1}{2}$  of  $\frac{1}{3}$  of  $\frac{1}{8}$  to a  
Decimal.

First the compound frac-  
tion  $\frac{1}{2}$  of  $\frac{1}{3}$  of  $\frac{1}{8}$  reduced to  
a simple one becomes  $\frac{1}{48}$

Then

$$8 \overline{) 0} \quad 15.0000$$

.1875

*Note.* It frequently happens that Decimals will not terminate, but that there will still be a remainder (as in this example) but if the decimal be continued to 4 or 5 places, it will be exact enough in most cases, and the remainder may be safely rejected as being so very inconsiderable.

## EXAMPLE

EXAMPLE 4.

Reduce me this fraction \* to decimal parts \*  $\frac{5}{16}$   
 And you shall arrive to be master of arts.

$$16 \left\{ \begin{array}{l} 2) 5.0 \\ 8) 2.5 \end{array} \right.$$

Answer .3125

C A S E 2.

To reduce the parts of money, weights, measure &c.  
 to a Decimal.

R U L E 1.

Reduce the parts to the lowest denomination given and express them as a vulgar fraction making the Integer (when reduced to the same name) the denominator. But *Note* if the given number be a simple one it needs no preparation, for it will be the numerator, and the Integer (in the same name) the denominator, with which vulgar fraction proceed as directed in the preceding page.

R U L E 2.

Place the numbers of the several denominations under each other beginning with the least, and divide each by such a number that will raise it to the next superior name (as directed in *Reduction of Integers*) placing each quotient as a Decimal part of the next dividend before it be divided, and the final quotient will be the answer.

EXAMPLE 1.

Reduce 18s 6d  $\frac{3}{4}$  to the decimal of a pound Sterling.

SOLUTION

## SOLUTION by

## Rule 1.

First  $18s\ 6d\ \frac{3}{4} = 891\ qrs$   
 Then  $891\ qrs = \frac{891}{960}$  of a  
 $\pounds$  which fraction reduced  
 by Case 1 page 294, makes  
 $.928125\ \pounds$  the decimal re-  
 quired.

## Rule 2.

By this me-  
 thod, first the  
 $4\ 3.0$  3 farthings  
 $12\ 6.75$  are reduced  
 $2\ 0\ 18.5625$  to the deci-  
 ————— mal of a  
 An.  $\pounds\ .928125$  penny, then  
 ————— the 6.75 pence to the de-

cimal of a shilling, and lastly the 18.5625 shillings to  
 the decimal of a pound.

## EXAMPLE 2.

Reduce  $15s$  to  
 the decimal of a  
 pound.

First  $15 = \frac{15}{20}$   
 of a  $\pounds$ .

Then (by Case 1  
 page 294)

$$\begin{array}{r} 2\ 0\ )\ 15.0 \\ \hline \end{array}$$

Answ.  $\pounds\ .75$

## EXAMPLE 3.

Reduce  $\pounds\ 4\ 15s\ 7d\ \frac{1}{2}$  to the de-  
 nomination of  
 pounds.

$$\begin{array}{r} 2\ 1.0 \\ 12\ 7.5 \\ 2\ 0\ 15.625 \\ \hline \end{array}$$

Anf.  $\pounds\ 4.78125$

## EXAMPLE 4.

Reduce  $18s\ 6d$   
 to the decimal of  
 a pound.

$$\begin{array}{r} 12\ 6.0 \\ 2\ 0\ 18.5 \\ \hline \end{array}$$

Anfw.  $\pounds\ .925$

## EXAMPLE 5.

What decimal part of a pound tell me true  
 Is six-pence.—This *Tyro* you'll presently do,  
 And shine with *Minerva*, in her fine retreat,  
 Where *Newtons*, *Boyles*, *Hallys* and *Emersons* wait.

First

First 6d =  $\frac{6}{240}$  of a £.

Then (by Case 1 page 294)

240) 6.00 (.025 Answ.

480

1200

1200

Or agreeable to Rule the 2d, thus

12)6.0

2)0.5

£.025

### EXAMPLE 6.

Reduce 36 poles to the decimal of an acre.

40)36.0

4) 0.9

Answ. .225

### EXAMPLE 8.

Reduce 15 dwt. 12 grs. to the decimal of an ounce Troy.

24 { 3)12

8) 4.0

2)0.15.5

Answ. .775

### EXAMPLE 7.

Reduce 4C. 3qrs. 8lb. to the decimal of a tun.

28 { 4)8.

7)2.0

4)3.285714†

2)0.4.821428†

Answ. .2410714†

### EXAMPLE 9.

Reduce 3 inches to the decimal of a yard.

12)3.0

3)0.25

Answ. .0833 &c.

These examples being well understood are sufficient to shew how to reduce any parts of other weights, measures, &c. into decimals, therefore shall now proceed to

CASE

## C A S E 3.

To find the value of any Decimal Fraction in the known parts of the Integer.

## R U L E

Multiply the given decimal by the known parts of the next inferior denomination, and point off in the product as many places of decimals as there are in the given decimal fraction, then reduce the decimal produced, to the next inferior name, pointing off the product as before, and so proceed to the least known denomination or as far as necessary, and the figures on the left hand the dots or points will be the value required.

## EXAMPLE 1.

I'th' parts in the margin \* come *Tyro* unfold, \* 26875  
The value, be't copper, be't silver or gold. parts of a £

$$\begin{array}{r}
 \text{£.} \\
 .26875 \\
 \text{20} \\

EXAM-

EXAMPLE 4.

Now Tyro advance learn the *Decimal* art,  
In surveying estates you'll then soon take a part,  
Come tell me the parts in the margin \* subjoin'd, \*.8375  
Of an acre of land roods and poles, both combin'd,  
Come do this thing clearly, no doubt very soon,  
You'll be a Surveyor, and measure the moon.

$$\begin{array}{r}
 .8375 \\
 \times 4 \\
 \hline
 3.35 \\
 40 \\
 \hline
 14.0 \\
 \hline
 \text{An. 3 rds. 14 pls.}
 \end{array}$$

EXAMPLE 5.  
What is the value of .8146 hhd.

$$\begin{array}{r}
 63 \\
 \hline
 24438 \\
 48876 \\
 \hline
 \text{A. 51.3198 gal.}
 \end{array}$$

EXAMPLE 6.  
What is the value of .775 oz. Troy.

$$\begin{array}{r}
 .775 \\
 20 \\
 \hline
 15.5 \\
 24 \\
 \hline
 120 \\
 \hline
 \text{A. 15dwt. 12grs.}
 \end{array}$$

C A S E 4.

To find the value of any Decimal by inspection, a pound Sterling being the Integer.

R U L E

Double the figure in the first place of the given decimal (*viz.* that figure next to the units) for shillings, and if the figure in the 2d place be 5 or more, then add 1 to the double of the first figure, and the 2d figure if under 5 or the excess if above 5 prefix to the 3d figure and reckon 'em as farthings, abating 1 when they are above 25 and 2 when above 40.

EXAMPLE

## EXAMPLE 1.

What is the value of .26875ℓ?

The first figure doubled with 1 added (because the 2d figure is more than 5) is 5s. then 1 (the second figure's excess above 5) prefix to 8 the third figure makes 18 farthings, viz. 4d  $\frac{1}{2}$  so that the value is 5s 4d  $\frac{1}{2}$  the same as in page 298.

## EXAMPLE 2.

What is the value of .928125ℓ?

The 9 doubled is 18s, and the 2 next figures viz. 28, abating 1 (as they are more than 25) make 6d  $\frac{3}{4}$  therefore the value is 18s 6d  $\frac{3}{4}$  the same as in page 298.

## EXAMPLE 3.

What is the value of 846ℓ?—The 8 doubled is 16s, and 46 farthings abating 2 are 11d, therefore the value is 16s 11d

## Amusing Questions.

## Question 1.

In the 2d book of *Samuel* Chap 14. we read that *Absalom* cut off the hair of his head every year, and that it weighed 200 half ounce Shekels. What was the weight in pounds and decimal parts of a pound.

First 200 Shekels or half ounces = 100 ounces

Then 
$$16 \left\{ \begin{array}{l} 2) 100 \\ \hline 8) 50 \end{array} \right.$$

Answer 6.25 = 6lb.  $\frac{1}{4}$

Question

Question 2.

*Goliath's* great gigantic size,  
 Six cubits \* and a span, †  
 He led his host with glaring eyes,  
 Cry'ng chuse me out the man,  
 Who dares in single combat fight  
 Me,—let him try his skill,  
 For I defy each *Isr'elite*,  
 His strength be what it will.  
 With glitt'ring helmet on his head,  
 Well arm'd with *Coat of Mail*,  
 Which just five thousand Shekels ‡ weigh'd,  
 His threats rang thro' the vale,  
 A brazen target on his breast,  
 Like posts § his legs did seem,  
 And his huge spear among the rest,  
 Was like a weaver's beam.  
 Whose head when weighed true we find  
 Six hundred Shekels more,  
 Enough to daunt young *David's* mind,  
 Then *Tyro* pray explore,  
 This Bravo!—This *P. Mifstine's* height  
 In *British* measure true,  
 And likewise tell his *Coat's* true weight  
 In pounds—and *Spear's* head too.

---

\* Of 1 foot 9.888 inches according to Dr. *Arbutnot*.

† Half a cubit.

‡ Of  $\frac{1}{4}$  an ounce Avoirdupoise.

§ Alluding to the greaves of brass upon his legs.

21.888 inches in one cubit

6.5 number of cubits

---

109440

131328

---

12) 142.272

---

3) 11.856

---

3.952

---

height in  $\left\{ \begin{array}{l} \text{inches} \\ \text{feet} \\ \text{yards} \end{array} \right.$

Then by proceeding as in the last question the 5000 Shekels (or half ounces) *the weight of his coat,* will be found to be  $156 \text{ lb. } \frac{1}{4} = 1 \text{ C.}$   
 $1 \text{ qr. } 16 \text{ lb. } 4 \text{ oz.}$   
 and the 600 Shekels (or half ounces)

*ces) the weight of his Spear's head*  $18 \text{ lb. } \frac{3}{4}$

## Question 3.

*Og king of Basban—scripture says*

His Iron bedsteads were

In length nine cubits, and the breadth

Was four—it does appear,

The length and breadth I pray unfold,

In *British* measure true,

And area of this Giant's bed,

All this with ease you'll do.

First 9 } cubits, the { length }  
 and 4 } { breadth }

multiplied into 1.824 foot (the length of a cubit)

produces 16.416 }  $\frac{9}{1}$  { lth. } of the bedsteads in feet.  
 and 7.296 }  $\frac{4}{1}$  { bth. }

Then (according to the rule at the bottom of page 80 for finding the area of a rectangular figure) 16.416 multiplied by 7.296 produces 119.771136 the area in feet, which divided by 9 (the square feet in a square yard) quotes 13.3 + the area in yards.

The

# The RULE of THREE in DECIMALS.

## R U L E.

**I**N *Decimals* the *Rule of Three*,  
 As *Integers* must worked be,  
 Your vulgar fractions turned fair  
 To Decimals,—then next prepare,  
 To state and work as taught before,  
 And you'll the answer soon explore. ●

## EXAMPLE 1.

When two eighths of a pound cost three fourths of a shilling,

The price of four fifths you may find if you're willing.

	<i>lb.</i>	<i>s.</i>	<i>lb.</i>
	.25	.75	.8
	:	::	
		.8	
		—	<i>s</i>
	.25)	.600	(2. 4
		50	12
		—	<i>d</i> —
		100	4.8
		100	4
		—	—
		0	$\frac{3}{4}.2$
		—	—

Answer 2s 4d  $\frac{3}{4}$

## EXAMPLE 2.

In a rich copper mine we find,

Three fifths was Jacob's share,

Who sold to bonny Kate so kind,

Three fourths it does appear;

For seventeen hundred and ten pound,

Of this his right thereto,

What was his share \* I pray expound, \* Interest

Come Tyro tell me true. in the mine.)

C c 2

First

# 304      *The Rule of Three in Decimals.*

First  $\frac{3}{4}$  of  $\frac{3}{2} = \frac{9}{4} = .45$  being that part of the whole which he sold for £1710.

Then If  $.45 : 1710 :: .75 = \frac{3}{4}$

$$\begin{array}{r} .75 \\ \hline 8550 \\ \hline \pounds 1970 \end{array}$$

$$\begin{array}{r} .5) 1282.50 \\ \hline .9) 2565.0 \\ \hline \end{array}$$

From	£2850	} the value of his	{ original	} share	
Take	1710				{ alienated
Rem.	1140				

Or divide £1710 by .45 and the quotient will be £3800 the value of the whole mine, from  $\frac{3}{4}$  of which viz. £2850 deduct £1710 and the remainder will be £1140 the value of his present share, the same as above.

## EXAMPLE 3.

Suppose 12 men mow down a field of grass in  $5\frac{3}{4}$  days, how many men (at the same rate of working) will mow down the same in 3 days?

Reciprocally as  $5\frac{3}{4} = 5.75 : 12 :: 3$  \*

$$\begin{array}{r} 3) 69 \\ \hline \end{array}$$

Answer 23 men

The

The *Rule of Three* in decimals (respect being had to the pointing) being exactly the same as *that* in Integers, wherein I have given such variety of examples makes it quite unnecessary to give any more in the *Rule of Three* in this place, so shall now give a few examples in the rule of *Practice* by decimals, and then proceed to treat of the *Square* and *Cube Roots*.

## PRACTICE IN DECIMALS.

**I**NGENIOUS *Tyro* here you see,  
How useful decimals must be,  
To all who are concern'd in trade,  
All tradesmen sure might crave their aid,  
Who wou'd with method quick and fair,  
Keep their accompt-books just and clear.

### EXAMPLES.

$s \ d$ $2 \ 6 \ \frac{1}{8} 6783 \text{ yards at } \frac{1}{2}$ $\frac{1}{2} \ \frac{1}{8} 847.875 \mid \text{pr. at } 2 \ 6$ $14.13125 \mid - \frac{1}{2}$ Answ. £ 14 2s 7d $\frac{1}{2}$	$2d \ \frac{1}{12} 10 \ 774 \text{ at } 1d$ $\frac{1}{8} \ 6.45 \mid \text{pr. at } 2d$ $.806 \mid - \frac{1}{4}$ $5.644 \mid$ Answ. £ 5 12s 10d $\frac{1}{2}$
$5s \ \frac{1}{4} 5746lb. \text{ at } \frac{3}{4}$ $\frac{3}{4} \ \frac{1}{8} 1436.5 \mid \text{pr. at } 5 \ d$ $17.956 \mid - \frac{3}{4}$ Answ. £ 17 19s 1d $\frac{1}{2}$ C c 3	$\frac{1}{8} 714 \text{ at } 2d \frac{1}{2}$ $\frac{1}{12} 89.25 \mid \text{pr. at } 2s \ 6d$ $7.4375 \mid - 2 \frac{1}{2}$ Answ. £ 7 8s 9d

## EXAMPLES.

2s	$\frac{1}{16} 157.25 (= 157 \frac{1}{4})$	at 2s 2d	129 at £1 13s 4d
2d	$\frac{1}{16} 15.725$	pr. at	$\frac{1}{16} 129$
	1.310	$\left\{ \begin{array}{l} 2s - d \\ - 2 \end{array} \right.$	64.5
	17.035	$\left\{ \begin{array}{l} 2s - d \\ - 2 \end{array} \right.$	21.5
			£215
			price at
			1 13 4
			C. qrs. lb.
			249 3 10 $\frac{1}{2}$ at £3
			2s 8d per C. See
			this example in page
			225. This weight
			reduced (by Case
			2 page 295.) will
			stand thus
			249.84375
			3
			£ s d
			249.53125 at 3 --
			24.984375 - 2 -
			8.328125 -- 8
			782.84375 at 3 2 8
			£782 16s 10d $\frac{1}{2}$ A.

Or thus

Multiply the given quantity 249.84375 (according to the *Contraction* in page 287) by 3.133333 = £3 2s 8d (the given price) and the product *viz* the answer, will be £782.8437 the same as above. So that by proceeding according to any of these methods, the value of any quantity of goods may be easily known at any given price. And now before I conclude this *excellent* rule, it may not be amiss to observe to the learner,

learner, that if the given price be a composite number, greater than 12 and an aliquot part of a pound &c. it is oftentimes more concise to divide by its component parts, as may be seen in several of the preceding examples in this rule *viz.*

In the example at	$\left\{ \begin{array}{cccccccccc} 1 & 1 & 1 & 2 & 3 & 7 & 10 & 15 \\ \frac{1}{2} & \frac{1}{3} & \frac{1}{4} & \frac{1}{2} & \frac{1}{3} & \frac{1}{4} & \frac{1}{2} & \frac{1}{2} \end{array} \right\}$										the divisors are	$\left\{ \begin{array}{ccccc} 6 & 4 & 8 & 8 & 4 \\ 4 & 4 & 4 & 4 & 4 \end{array} \right\}$					and	$\left\{ \begin{array}{ccccc} 60 & 80 & 12 & 8 & 8 \\ 4 & 6 & 8 & 8 & 4 \end{array} \right\}$					the com. parts of	$\left\{ \begin{array}{ccccc} 480 & 320 & 96 & 64 & 32 \\ 16 & 24 & 32 & 64 & 96 \end{array} \right\}$					the aliquot part that, the giv. price	$\left\{ \begin{array}{cccccccccccc} 1 & 1 & 2 & 3 & 7 & 10 & 15 \\ \frac{1}{2} & \frac{1}{3} & \frac{1}{4} & \frac{1}{2} & \frac{1}{3} & \frac{1}{4} & \frac{1}{2} \end{array} \right\}$										is of a pound,

## EXTRACTION of the SQUARE ROOT.

COME Tyro haste, your skill exert,  
To learn this Rule pray be expert,  
For Evolution points out fair  
How roots of squares extracted are,  
All this with ease you'll quickly know,  
By th' Table and the Rule below.

### TABLE.

Roots	1	2	3	4	5	6	7	8	9
Squares	1	4	9	16	25	36	49	64	81

### R U L E.

YOUR periods pointed fair and true  
Under the first, before put you  
The nearest square you find come to't  
And for the quotient place the root,

Then

Then from that period next subtract  
 Th' aforesaid square to be exact  
 To this observe next period's brought  
 The quotient doubled—next is sought  
 What times that quote contain'd will be  
 In the resolvend—*Tyro* see  
 You leave your units place quite free.  
 Because that place your square supplies,  
 As th' quoted figure multiplies,  
 Subtracting next you thus go on,  
 Until your operation's done,  
 But if you find your number be  
 A furd—observe me instantly,  
 Periods of cyphers bring thereto,  
 For decimals work nearly true.

EXAMPLE I.

What is the Square Root of 76176 ?

$$\begin{array}{r}
 76176 \text{ (276 Root)} \\
 4 \phantom{00000} \\
 \hline
 47) 361 \\
 \phantom{00} 329 \\
 \hline
 546) 3276 \\
 \phantom{00} 3276 \\
 \hline
 \end{array}$$

EXPLANATION.

The number being separated or pointed into periods of 2 figures each, then the nearest square number to 7 the first period is 4 which is set under and subtracted therefrom, and 2 the square

root of 4 is placed in the quotient, and to the remainder 3 the next period 61 is brought down or annexed which makes 361 for a new dividend or resolvend, to the left hand whereof is placed 4 *viz.* the quotient doubled or multiplied by 2, and as 36 (part of the resolvend) contains 4 (part of the divisor) with what will be carried to the product, 7 times, 7 is set in the quotient and to the right hand of the divisor

## 310 *Extraction of the Square Root.*

divisor also, making it 47 which being multiplied by 7 the product 329 is set under and subtracted from 361 the new resolvend, and to 32 the remainder, 76 the 3d and last period is annexed making 3276 for another new resolvend, to the left of which is placed 54 the double of the quotient 27, then as 54 is contained in 327 (part of the new resolvend) 6 times therefore 6 is placed in the quotient and likewise to the right of the divisor, making it 546 which being multiplied by the quotient figure 6, the product 3276 is set under the resolvend, and as nothing remains the work is finished and 76176 found to be a square number and 276 its root. Hence it is easy to

### O B S E R V E

That every Root must consist of as many places of figures as there are periods in the given number, and will be Integers or Decimals respectively as the periods are so, from which they are found or to which they correspond. And also that doubling the unit's figure of each divisor *viz.* adding thereto its unit's figure produces part of the succeeding divisor the same (*and is full as expeditious*) as the before-mentioned method of doubling the quotient, for (in this example) 27 doubled makes 54 (part of the last divisor) and so does the first divisor 47 when added to 7 its unit's figure.

To prove the square root is only to multiply the root by itself thus  $276 \times 276 = 76176$  the given resolvend in this example.

EXAM-

*Extraction of the Square Root.* 311

**EXAMPLE 2.**  
**Extract the square root of**

$$\begin{array}{r} 29506624 \quad (5432 \\ 25 \quad \text{Root} \\ \hline 104) \quad 450 \\ \quad 416 \\ \hline 1083) \quad 3466 \\ \quad 3249 \\ \hline 10862) \quad 21724 \\ \quad 21724 \\ \hline \end{array}$$

**EXAMPLE 3.**  
Extract the square root of

$$\begin{array}{r}
 .0001522756 \quad (.01234 \\
 \text{Root} \\
 \hline
 22) \quad 52 \\
 \quad 44 \\
 \hline
 243) \quad 827 \\
 \quad 729 \\
 \hline
 2464) \quad 9856 \\
 \quad 9856 \\
 \hline
 \end{array}$$

EXAMPLE 4.  
Extract the square root of 5467.184.

$$\begin{array}{r}
 5467.1840 \quad (73.94040 \\
 49 \\
 \hline
 143) \quad 567 \\

 13221 \\
 \hline
 14784) \quad 59740 \\
 59136 \\
 \hline
 1478804) \quad 6040000 \\
 5915216 \\
 \hline
 147880808) \quad 1247840000 \\
 1183046464 \\
 \hline
 1478808164) \quad 6479353600 \\
 5915232656 \\
 \hline
 564120944
 \end{array}$$

In the given number of this example there being but 3 decimals, a cipher was annexed to make 'em up an even number, in order that they might be divided into periods as before, and when any number to be extracted is (like *this*) not a square but irrational, periods of ciphers may be added at pleasure,

## 312 *Extraction of the Square Root.*

pleasure, and the further you proceed, the more exact will the root be, but for common purposes 4 places of decimals are sufficient.

But when the root is to be extracted to a great number of places, the work may be much abbreviated thus, proceed by the common method till you have one figure more than half the number there is to be in the root; then divide the remainder (according to the *contraction* in division of decimals *page 292*) by the double root except the right hand figure, and the quotient will be the remaining part of the root, as in this example, the remainder after multiplying by the 6th figure in the root is 124784 which being divided (agreeable to the above-mentioned *contraction*) by 147880 (the corresponding divisor or double of the root except the right hand figure) quotes 084 &c. the remaining part of the root as in the preceding *page*.

### C O R O L L A R Y.

*When the Square Root of any vulgar fraction is required*—Take the Root of the numerator and denominator if the fraction be a complete power, thus the Square Root of  $\frac{25}{81}$  is  $\frac{5}{9}$ , but if the fraction be not a complete power, then reduce it to a decimal and proceed as herein before taught.

## The U S E of the SQUARE ROOT.

*To find a mean proportional between any two given numbers.*

### R U L E

To find a mean proportional  
Of any numbers great or small  
The square root of their product true  
Brings out an answer to your view.

Question

# The Use of the Square Root. 313

## Question 1.

Find a mean proportional between 36 and 64.

First  $36 \times 64 = 2304$  then  $\sqrt{2304}$  (48 Answer,  
16

$$\begin{array}{r} 88) 704 \\ 704 \\ \hline \end{array}$$

Proof

$$\text{As } 36 : 48 :: 48 : 64 \quad \begin{array}{r} 0 \\ \hline \end{array}$$

## Question 2.

If th' area of a circle be

As in the margin \* you may see

\* 33124

What is the side then of a square,

Equal in area, pray declare.

The square root of 33124 = 182 the Answer.

## Question 3.

To humble *France*, suppose a Gen'ral sent

With a fine army o'er the continent,

Whose number just of valiant fighting men,

Is forty thousand, four hundred and one,

How many men in rank and file must be

To form a square battalia tell to me.

The square root of 40401 = 201 the Answer.

## Question 4.

A set of true Britons all jovial and free,

Were drinking full bumpers to dear LIBERTY,

Till the reck'ning came to the sum \* here subjoin'd

The number of persons,—haste *Tyro* and find,

Whose share must be equal, this tell unto me,

No doubt but *Macenas* will smile upon thee.

D d

\* 33124

## §14      *The Use of the Square Root.*

$$\begin{array}{r} \text{£} \quad \text{s} \quad \text{d} \quad \text{farthings} \\ 1 \quad - \quad - \frac{1}{4} = 961 \text{ (31 men Answer} \\ \quad \quad \quad 9 \end{array}$$

$$\begin{array}{r} 61 \overline{) 61} \\ 61 \\ \hline \end{array}$$

$$\begin{array}{r} 61 \\ \hline \end{array}$$

$$\begin{array}{r} . \\ \hline \end{array}$$

men farthings man d

If 31 : 961 :: 1 : 7  $\frac{3}{4}$  each man's share.

## PROMISCUOUS QUESTIONS.

Question 1. By Mr. *Rob. Wilson*, *Ladies Diary* 1713.

A castle wall there was whose height was found  
To be one hundred feet, from th' top to th' ground,  
Against the wall, a ladder stood upright,  
Of the same length, the castle was in height.  
A waggish fellow did the ladder slide  
(The bottom of it) ten feet from the side.  
Now I would know how far the top did fall,  
By pulling out the ladder from the wall.

$$\begin{array}{l} 100 \\ 10 \end{array} \left. \vphantom{\begin{array}{l} 100 \\ 10 \end{array}} \right\} \text{squared} = \begin{array}{r} 10000 \\ 100 \end{array}$$

Difference 9900 the square root where-  
of viz. 99.498+ feet, is the height of the wall to the  
top of the ladder after it was pull'd out, which being  
deducted from 100 feet the whole height of the wall,  
leaves .502 viz. a little more than *half a foot*, the  
answer.

Question

Question 2. By Mr. Massey. *Ladies Diary*, 1716.

A wealthy *Knight* in *Lincolnshire* resides,  
Whose fields are wash'd by the redundant tides  
Of *Witham's* crystal stream ; his chiefest care  
*Pomona* like is now to bless the year ;  
With fruitful products from the teeming tree,  
For none more vers'd in rustic cult' than he.  
Oblong in form, extended from his house,  
He did a closure for his garden chuse  
With chosen walnut plants, he set it round  
At once to shade his walks and load the ground,  
Succeeding Summers, with prolific heat,  
Manur'd the infant trees, and made them great.  
That they expand their tow'ring heads in air,  
And store of barricaded kernels bear ;  
*September* last the *Knight* his man employ'd.  
To gather all the nuts his trees supply'd,  
The man returns and with mysterious phrase  
Premeditated to his master says.  
*Sir*, your commands, I willingly obey'd,  
And as I wrought, this observation made,  
On ev'ry tree so many boughs are found,  
As there are trees in all your garden round.  
Nine of these trees as many walnuts bear,  
As upon all the trees there branches are,  
If that you multiply this sum by three,  
You in the product all the nuts may see. (2187)  
What *Sir*, from this account I humbly crave  
Is that you tell how many trees you have,  
The *Knight* unskill'd in such conceits as those,  
Took up the nuts, and smiling off he goes ;  
But turning short again, says, hark you *Nat*,  
Send Mr. *Tipper's* correspondents that.

3) 2187

Boughs 729 (27 trees Answer

4

47) 329  
329trees nuts trees nuts  
If 9 : 729 :: 27 : 2187.

---

---

**EXTRACTION of the CUBE ROOT.**

**A** *Cube* (I say) to tell you true,  
 Contains length, breadth, and thickness too,  
 A *Cube's* a figure you may see,  
 Derived from *Geometry*.  
 How to extract in ev'ry part,  
 And find the root——pray get by heart  
 The following *Table* which you view,  
 And *Rule* I here present to you.

**TABLE.**

Roots	1	2	3	4	5	6	7	8	9
Squares	1	4	9	16	25	36	49	64	81
Cubes	1	8	27	64	125	216	343	512	729

**R U L E.**

“ The cube of your first period take,  
 “ And of its root a quotient make.”  
 Subtract this cube and what you find  
 To be the diff'rence, left behind,  
 To that bring down th' next period true,  
 Your dividend appears in view.  
 A true divisor next to find,  
 First to the quote, a cypher's join'd,  
 Then call it *R*, and let that be,  
 First squar'd, then multiply'd by *three*,

**Now**

Now ask how oft this number can  
 Within the dividend betwixt  
 The quote call *S*, then by it you  
 Must multiply the divisor too,  
 This product you must write down plain  
 Under the dividend—again.  
 Next multiply your *R* by three,  
 And that by th' square of *S* must be  
 Involv'd, put down, the root t' express,  
 Write under that the cube of *S*.  
 These sums being added up and penn'd,  
 Subtract them from your dividend,  
 To what remains th' next period's brought,  
 If any more, or roots are sought.

**EXAMPLE I.**

What is the Cube Root of 32768 ?

$$\begin{array}{r}
 32768 \text{ (32 Root.} \\
 \underline{27} \\
 30 \times 30 \times 3 = 2700 \text{ ) } 5768 \text{ Dividend.} \\
 \begin{array}{l}
 R \} = \{ 30 \\
 S \} = \{ 2
 \end{array}
 \end{array}$$

$$\begin{array}{r}
 5400 = 30 \times 30 \times 3 \times 2 = R^2 \times 3 \\
 360 = 30 \times 3 \times 4 = R \times 3 \times S^2 \\
 8 = 2 \times 2 \times 2 = S^3.
 \end{array}$$

$$\begin{array}{r}
 \underline{\hspace{1cm}} \\
 5768 \text{ subducend}
 \end{array}$$

**EXPLANATION.**

The nearest cube to 32 the first period is 27, which is set under and subtracted therefrom, and 3 the root of the said cube is placed in the quotient, and to the remainder 5, the period 768 is annexed which makes 5768 for a dividend, then a cipher is joined to the quotient figure 3 making it 30 which is call'd *R*, and

*D d 3*

**EXPLA-**

being squared and that square multiplied by 3 produces 2700 for a divisor which being contained twice in the dividend, 2 is placed in the quotient and called  $S$  by which the divisor is multiplied and the product 5400 set under the dividend, then 3 times  $R = 90$  is multiplied by 4, the square of  $S$ , and the product 360 is placed under the 5400, and lastly 8 the cube of  $S$ , is placed under, and added to the other two numbers under the dividend, and the sum 5768 being the same as the dividend and no more periods to be brought down the work is finished, 32768 found to be a cube number and 32 its cube root.—To prove the cube root is only thrice involving the root into itself *viz.* multiplying the root by itself and that product or square by the same root again, thus, the cube of 32 is  $32 \times 32 \times 32 = 32768$  the given resolvend in this example.

**EXAMPLE 2.**

What is the cube root of 242970624?

$$\begin{array}{r} 242970624 \text{ (624 root.} \\ 216 \\ \hline \end{array}$$

$$R^2 \times 3 = 10800) \quad 26970 \text{ dividend}$$

$$\begin{array}{l} R \} = \left\{ \begin{array}{l} 60 \\ 2 \end{array} \right. \quad \begin{array}{l} 21600 = R^2 \times 3 \times S \\ 720 = R \times 3 \times S^2 \\ 8 = S^3 \end{array} \end{array}$$

$$\hline 22328 \text{ subducend}$$

$$R^2 \times 3 = 1153200) \quad 4642624 \text{ 2d. dividend}$$

$$\begin{array}{l} \text{Here } R \} = \left\{ \begin{array}{l} 620 \\ 4 \end{array} \right. \quad \begin{array}{l} 4612800 = R^2 \times 3 \times S \\ 29760 = R \times 3 \times S^2 \\ 64 = S^3 \end{array} \\ \text{and } S \end{array}$$

$$\hline 4642624 \text{ subducend}$$

EXAMPLE 3.

The side of a cubical vessel define,

T contain less nor more than four gallons of wine.

A gallon of wine being 231 solid Inches (see page 20) then four gallons must be 4 times as many viz 924 (9. 739 Root or side of the vessel.

$R = \{ 90 \}$   
 $S = \{ 7 \}$

24300) 195000

170100

13230

343

183673

Here  $R = \{ 970 \}$   
and  $S = \{ 3 \}$

2822700) 1327000

8468100

26190

27

8494317

Here  $R = \{ 9730 \}$   
and  $S = \{ 9 \}$

284018700) 2832683000

2556168300

2364390

729

2558533419

274149581

In this example you may observe that tho' the *first* divisor is contained 8 times and the *second*, 4 times, in their respective dividends, yet only 7 and 3 are placed in the quotient or root because subducends produced from 8 and 4 would be too much viz. greater than the dividends. To extract the Cube Root of a vulgar fraction observe the directions given for extracting the Sqr. Root thereof, in page 312 only use the Cube Root instead of the Sqr. Root.

## S C H O L I U M.

The foregoing method of extracting the cube root being very practical and easy to be understood, I shall now shew how to perform the same by easy divisions and an extraction of the square root. — Suppose any number at pleasure which you think will come pretty near the root, but less; divide the resolvend by 3 times the supposed number, from the quotient deduct  $\frac{1}{2}$  of the square of the supposed root, and to the square root of this remainder add half the supposed root, and the sum will be the true root.

## EXAMPLE I.

What is the cube root of 32768? — See this example page 317.

Suppose the root to be 30 which multiplied by 3 produces 90 whereby dividing 32768 quotes

364.08 &c.

From which deduct  $\frac{1}{2}$  of 900 (the sqr. of the supposed root) viz.

75

and the remainder is 289.08 &c.

289 (17) 15 = half the suppo. root.

27) 189 32 Answer the same as in page 317.

## EXAMPLE 2.

What is the cube root of 242970624? — See this example page 318.

Suppose the root to be 600 which multiplied by 3 produces 1800 by which dividing 242970624

quotes 134983.68

From which deduct  $\frac{1}{2}$  of 600  $\times$  600 viz.

30000

Remainder 104983.68

$\sqrt{104983.68} = \begin{cases} 324 \\ 300 \end{cases}$

Ans. 624 the same as in page 318.

The extraction of Roots of higher powers being of little or no use in practical arithmetic I shall therefore give no general rule for their extraction but only just observe to the learner that most of them may be wrought by observing what Integer numbers multiply'd together will produce the index of the required Root and making such extractions as are denominated by those numbers thus, 2 the index of the Square Root multiplied by 2 produces 4 the index of the biquadrate Root therefore for that Root extract twice the Square Root, for the sixth Root

Extr. }  $\frac{1}{2}$  { Sqr. } Root and then the { Cube } Root of that.  
 Or }  $\frac{1}{3}$  { Cube }

because the Indices of those Roots viz 2 and 3 multiplied together make 6 the Index of the required Root, so for the eighth Root extract thrice the square Root, the cube or third power of 2 (the Index of the square Root) being 8, and for the ninth Root extract twice the cube Root because 3 its Index raised to the second power viz. multiplied by 3 produces 9 the Index of the Root required, and so on as far as you please.

I shall now give a few questions to shew the use of the *Cube Root* in some few particulars and then proceed to treat of *Simple* and *Compound Interest*.

The

## The Use of the CUBE ROOT.

### Question 1.

Find two mean proportionals between two extremes  
5 and 135

5) 135 (27. whose cube Root is 3  
5 the less extreme.

Proof

As 5 : 15 :: 45 : 135      15 less mean.

3

45 greater mean.

Here the greater extreme is divided by the less, and the cube Root of that quotient multiplied by the less extreme, gives the less mean which multiplied by the said cube Root gives the greater mean, as above.

### Question 2.

*Sawney* a youth, with an accomplish'd air,  
Long courted *Moggy*, delicate and fair,  
To gain her friendship ev'ry art essays,  
To meet her kindness tries a thousand ways,  
A glob'lar silver snuff-box *Sawney* buys,  
And gives his *Moggy* with unfeigned sighs,  
Which cost a guinea as it does appear,  
Three inches just was the diameter,  
Now *Sawney* thinks the box was rather small,  
Soon the silver smith again does call  
To change the box—an inch and quarter more  
Was the diameter than that before.  
Now *Tyro* tell me what the snuff box cost,  
And then of your expertness you may boast.

*First*

First 3 } the diam. of the { 1 ft } Box cu. 27  
 And 4.25 } { 2 d } bed is { 76.7656 } c

Then as all like solids are in triple proportion to their homologous sides, diameters, lines &c. the proportion is.

$$\begin{array}{r}
 \text{CD} \quad \quad \quad \text{C D} \\
 \text{As } 27 : 21 = 1.05 :: 76.7656 \\
 \quad \quad \quad \quad \quad \quad 1.05 \\
 \quad \quad \quad \quad \quad \quad \hline
 \quad \quad \quad \quad \quad \quad 3838280 \\
 \quad \quad \quad \quad \quad \quad 7676560 \\
 \quad \quad \quad \quad \quad \quad \hline
 27 \left\{ \begin{array}{l} 3) 80.60388 \\ \hline 9) 26.86796 \\ \hline \end{array} \right. \\
 \text{Answer} \quad \quad \quad \text{£ } 2.98532 = \text{£ } 2 \text{ } 19 \text{ } 8 \text{ }
 \end{array}$$

Question 3.

A Farmer lent his neighbour *Gay*,  
 To serve him in his need;  
 Just sixteen feet of good old hay,  
 In length, breadth, depth indeed.  
 The neighbour brings him twice we find,  
 Eight feet \* it was no more,  
 What was the diff'rence left behind,  
 Come *Tyro* now explore?

$$\begin{array}{r}
 16 \times 16 \times 16 = 4096 \\
 8 \times 8 \times 8 \times 2 = 1024 \\
 \hline
 \text{Answer } 3072
 \end{array}
 \left. \begin{array}{l} \\ \\ \end{array} \right\} \text{solid feet}
 \left\{ \begin{array}{l} \text{borrow'd} \\ \text{repaid} \\ \text{unpaid} \end{array} \right.$$

P R O M I S.

\* In length breadth and depth each time.

## PROMISCUOUS QUESTIONS.

Question 1. By Mr. Hill.

If a Ship of 100 tuns be 44 feet long at the keel, of what length shall the keel of that Ship be, whose burthen is 220 tuns?

*First*  $44 \times 44 \times 44 \times 220 = 18740480$  which being divided by 100 quotes 187404.8 the cube root whereof is 57.22592 feet the answer.

Question 2. By Mr. J. Fish of Crowl, *Martin's Misc.* What dimensions must I give to a joiner, to make a cubical Box that will hold 2000 Oranges of  $2\frac{1}{2}$  Inches diameter each, supposing the Oranges Globular, keeping that form, and laid in rows exactly at the top of each other.

*Solution.*

*First*  $2.5 \times 2.5 \times 2.5 = 15.625$  the solidity of one cube which being multiplied by the number of oranges produces 31250 the solidity of the 2000 cubes, or that of the box.

Then  $\sqrt[3]{31250} = 31.5$  inches fere the side of the box.

## SIMPLE INTEREST.

**T**YRO advance! with skill prepare,  
 To calculate your Int'rest fair;  
 And find the gain, *per cent, per annum,*  
 Of sums lent out by *Aunt* or *Grannum*.  
 By *Simple Int'rest* you will find,  
 Much knowledge to enlarge the mind.  
 The *Principal* and *Int'rest* count,  
 The sum of both makes the *Amount*.

By

By *Simple Int'rest* we shall shew  
How to make calculations true,  
In *Fact'rage*, *Brokage*, and *Insurance* too,  
And *purchasing Stocks*, as you will find,  
In th' pages hereunto subjoin'd.

R U L E.

To find the Int'rest for a year,  
To multiply you must prepare  
The principal by th' rate that's given,  
The sum *per Cent.* be't odd or even;  
Then lastly by *one hundred* you  
Before divide th' product true,  
The answer will appear in view.  
If Int'rest for more years than one  
Shou'd be requir'd 'tis quickly done,  
The first year's Int'rest multiply  
By th' whole \* the answer you'll descry,  
For part or parts, the sum t'obtain,  
Take parts thereof, of one year's gain;  
And if for months, the Int'rest you  
Require:—observe this maxim true,  
In al'quot parts; the months divide,  
The answer may be soon espy'd.  
And if for weeks, be more or less,  
Which al'quot parts, will not exprefs;  
The number multipli'd must be  
By th' Interest of a year—you'll see  
If you divide by *fifty two*,  
The quotient will your answer shew.  
For days,—observe to multiply  
By one year's Int'rest you'll descry  
An answer—when you last divide  
By th' days, that's in one year beside.

---

\* Number of years.

## EXAMPLE I.

What is the Interest of 300 Guineas for a year, at £5 per Cent?

$$\text{As } \begin{array}{c} \text{£} \\ 100 \end{array} : \begin{array}{c} \text{£} \\ 5 \end{array} :: \begin{array}{c} \text{£} \\ 315 \end{array} = 300 \text{ Guineas}$$

$$\begin{array}{r} \text{£ } 15 \overline{) 75} \\ \underline{30} \\ 45 \\ \underline{30} \\ 15 \\ \underline{15} \\ 0 \end{array}$$

*Note.* The dividing by 100 in this and the following examples (where needful) is performed by cutting off the figures with a straight line. See the reason page 291.

2d. By *Practice*.

$$\begin{array}{r} \text{£} \\ 5 = \frac{1}{20} ) \text{£ } 315 \\ \hline \end{array}$$

Answer £15 15s

3d. By *Decimals*

$$\begin{array}{r} \text{£} \\ 315 \text{ principal} \\ .05 \text{ ratio} \\ \hline \end{array}$$

Ans. 15.75 = £15 15s

The above example is worked by 3 different methods, to shew the conciseness of each.—The ratio or rate of £1 for a year at the given rate is thus found. As £100 : £5 :: £1 : £.05 and so may any other ratio be found as in the annexed table.

TABLE

Rate	Ratio
3	.03
3 $\frac{1}{2}$	.035
3 $\frac{3}{4}$	.0375
4	.04
4 $\frac{1}{4}$	.0425
4 $\frac{1}{2}$	.045
5	.05

*Note.* Lawful Interest is £5 per cent. per annum, that is £5 for the use or Interest of £100 for a year or 12 months.

EXAMPLE

## EXAMPLE 2.

At Simple Interest tell me plain,  
What fourteen thousand pound will gain ;  
At three pound ten *per cent. per annum*,  
For seven years to please a *Grannum*.

$$\begin{array}{r}
 \text{£} \\
 \frac{1}{2}) \quad 14000 \\
 \quad \quad 3 \frac{1}{2} \\
 \hline
 \quad 42000 \\
 \quad \quad 7000 \\
 \hline
 \quad 490 \text{ Int. for 1 yr} \\
 \quad \quad 7 \text{ No. of yrs.} \\
 \hline
 \text{Answ. } 3430
 \end{array}$$

By *Decimals*.

$$\begin{array}{r}
 \text{£} \\
 14000 \text{ principal} \\
 .035 \text{ ratio} \\
 \hline
 70000 \\
 42000 \\
 \hline
 490 \text{ Int. for 1 yr.} \\
 7 \text{ No. of yrs.} \\
 \hline
 \text{£ } 3430 \text{ Answer}
 \end{array}$$

## EXAMPLE 3.

What is the Interest of £206 12s for  $4\frac{1}{4}$  years;  
at £5  $\frac{1}{2}$  *per cent. per annum*?

$$\begin{array}{r}
 \text{£} \quad \text{s} \\
 5 \overline{) 206 \ 12} \\
 \hline
 10 \overline{) 10 \ 6 \ 7 \ \frac{3}{4}} \\
 \quad 1 \quad - \quad 7 \ \frac{3}{4} \\
 \hline
 \quad 11 \quad 7 \quad 2 \ \frac{3}{4} \\
 \quad \quad \quad 4 \ \frac{1}{4} \text{ No. of years}
 \end{array}
 \left. \begin{array}{l} \text{Int. for 1} \\ \text{year at} \end{array} \right\} \begin{array}{r} \text{£} \quad \text{s} \\ 5 \quad - \\ - \quad 10 \\ \hline 5 \quad 10 \end{array} \left. \begin{array}{l} \\ \end{array} \right\} \text{per Cent.}$$
  

$$\begin{array}{r}
 45 \quad 8 \quad 11 \\
 2 \quad 16 \quad 9 \ \frac{1}{2} \\
 \hline
 \text{Answer } \text{£ } 48 \quad 5 \quad 8 \ \frac{1}{2}
 \end{array}
 \left. \begin{array}{l} \text{Int. for} \\ \end{array} \right\} \begin{array}{l} 4 \text{ years} \\ \frac{1}{4} \\ \hline 4 \ \frac{1}{4} \text{ years.} \end{array}$$

## EXAMPLE 4.

What will £342 amount to in 10 months at £5 per Cent. per Annum.

$$\begin{array}{r} \text{£} \quad \text{s} \\ 5 \overline{) \frac{1}{20} 342} \\ 6 \text{ mo. } \overline{) \frac{1}{2}} \quad 17 \text{ 2s In. for 1 yr.} \\ 4 \text{ mo. } \overline{) \frac{1}{3}} \end{array}$$

$$\begin{array}{r} \text{To} \quad 8 \quad 11 \\ \text{Add} \quad 5 \quad 14 \\ \hline \text{Th. to} \quad 14 \quad 5 \\ \text{Add} \quad 342 \quad - \text{the princi.} \\ \hline \text{£} 356 \quad 5 \text{ Ans.} \end{array}$$

## EXAMPLE 5.

What is the amount of £400 for 13 weeks, at £4  $\frac{3}{4}$  per Cent. per Annum?

$$\begin{array}{r} \text{£} \\ 400 \\ 4 \frac{3}{4} \\ \hline 1600 \\ 300 \\ \hline \frac{1}{4} \overline{) 19} \quad \left. \begin{array}{l} \text{To} \\ \text{Add} \end{array} \right\} \begin{array}{l} \text{Int. for} \\ \text{13 w} \end{array} \quad \left. \begin{array}{l} 1 \text{ yr.} \\ \text{princp.} \end{array} \right\} \begin{array}{l} \text{the} \\ \text{amount} \end{array} \\ \hline \text{An. £} 404 \quad 15 \end{array}$$

## EXAMPLE 6.

What is the Interest of £68 5s 8d for 3 years and 7 months, at £4 5s per Cent. per Annum?

$$\begin{array}{r} \text{£} \quad \text{s} \quad \text{d} \\ \frac{1}{4} \overline{) 68 \quad 5 \quad 8} \quad \text{£} \quad \text{s} \\ 4 \frac{1}{4} = 4 \quad 5 \\ \hline 273 \quad 2 \quad 8 \\ 17 \quad 1 \quad 5 \\ \hline * \text{£} 2 \overline{) 90 \quad 4 \quad 1} \\ 20 \\ \hline \text{s} 18 \quad 04 \\ 12 \\ \hline \text{d} - 49 \\ 4 \\ \hline \frac{1}{4} \overline{) 96} \end{array}$$

 \qquad \qquad \text{Answer } \underline{\underline{£ 656 \text{ 12 9\frac{3}{4}}}}
 \end{array}$$

*Note.* This question or any other of the kind may be easily answered by the help of the decimal table in the following page.

}

the

{

Int.

Prin.

Amount

\* Per Annum.

TABLE.

Or by the help of the annex table, thus

The tabular number—.00012328767 multiplied by £ 630 the principal, and that product by 343 the number of days, produces £26.6412 &c. = 26 £ 12s 9d  $\frac{3}{4}$  the interest the same as in page 329.

Rate per Cent.	Int. of £1 for a Day
£	£
3 =	.00008219178
3 $\frac{1}{2}$ =	.00009589041
4 =	.00010958904
4 $\frac{1}{2}$ =	.00012328767
5 =	.0001369863
5 $\frac{1}{2}$ =	.00015068493
6 =	.00016438356

### EXAMPLE 9. *For the Ladies.*

Old Jerry, had a daughter gay,  
 Whose wit and charms might vie,  
 With *Flora*, goddess of the May,  
 Or blooming *Margery*.  
 Young *Hodge*, a jocund country swain,  
 When tripping thro' the grove,  
 Oft sigh'd, and wish'd this maid to gain,  
 His thoughts were built on love.  
 At length he gain'd the maid's consent,  
 To visit *Hymen's* shrine,  
 And to the Church they straightway went,  
 Where love and friendship join.  
 Old Jerry, (like a father) kind,  
 Gave to them as appears,  
 A sum, at int'rest as we find,  
 Had been for seven years  
 And threescore days as writings shew,  
 The sum five hundred pound;  
 When first put out, believe it true,  
 (Here kindness did abound.)  
 At simple int'rest *Ladies* find,  
 Th' amount of this their store,  
 Which pleas'd the happy pair so kind,  
 At five per Cent. \* explore,      \* per Annum.

## R U L E

First  $500 \times .05 =$   
 $\pounds 25$  the Int. for 1 year  
 which being multipli-  
 ed by 7 the number of  
 years, produces

Dys	£	Dys	
As 365 : 25 :: 60			
60			

---

365) 1500 (4.1095 &c. = 4    2    2  $\frac{1}{4}$

---

Then to 179    2    2  $\frac{3}{4}$   
 Add 500 — — —

---

Anfw. 679    2    2  $\frac{1}{4}$

the  
Interest for  
7 years  
60 days  
7 ys & 60 dys  
Principal  
Amount

Or, the Interest for the 60 days may be found by the help of the *Table* in page 330 thus .0001369863 the tabular number at  $\pounds 5$  per Cent. multiplied by 60 and that product by  $\pounds 500$  the principal, produces  $\pounds 4.1095$  &c. =  $\pounds 4$  2s 2d  $\frac{1}{4}$  the Interest for the 60 days, the same as above.

## C O R O L L A R I E S.

*Cor. 1.* When the interest, rate, and time, are given to find the principal.—Divide the interest, by the product of the ratio and time, the quote is the principal.

*Cor. 2.* When the amount, rate, and time, are given to find the principal.—To the product of the ratio and time add unity, by which sum divide the amount, the quote is the principal.

*Cor. 3.* When the principal, interest, and rate, are given to find the time.—Divide the interest by the product of the principal and ratio, the quote is the time.

*Cor.*

## EXAMPLE 13.

In what time will two hundred *Moidores* raise,  
 (At simple int'rest,) tell me if you please,  
 A stock of just four hundred *Ports* define,  
 At three *per Cent.* in royal *British* coin.

$$\begin{array}{rcl}
 \text{First 400 Ports} & \left\{ \begin{array}{l} \text{£ } 16 \\ \text{at } 17 \end{array} \right\} & \text{a piece} = \begin{array}{r} \text{£ } 720 \\ \hline 270 \end{array} \\
 \text{and 200 Moids.} & & \\
 & & \text{Remains } 450 \quad \left\{ \begin{array}{l} \text{St. or Am.} \\ \text{Principal} \\ \text{Interest} \end{array} \right.
 \end{array}$$

Then by Cor. 3. Page 331.

$$\begin{array}{rcl}

## SCHOLIUM.

Having given variety of examples to shew the ingenious learner how to proceed with Simple Interest, I shall now add a few examples concerning *Factorage*, or *Commission*, *Brokage*, *Insurance*, and purchasing *Stocks*, and then proceed to *Compound Interest*, or *Interest upon Interest*.

*Factorage*; *Provision*, or *Commission*, is an allowance that is generally made to agents, or factors beyond Sea, for buying or selling of goods, at a given or certain rate *per Cent.* according to the custom of the country the factor, or merchant resides in.

*Brokage*, is an allowance made to brokers, or any person who is employed to assist others in buying, or disposing of their goods, and in *London* are not to act without the *Lord-Mayor's* licence.

*Insurance*,

*Insurance*, is security given by persons who oblige themselves to answer for the loss or damage of ships, houses, goods &c. by storms, pirates, fire, &c. in consideration of a premium paid down to restore whatsoever value the premium is advanced for by the proprietors of the thing injured.

*Stocks* are the public funds of the nation, the shares whereof are transferable from one person to another, and occasion that extensive business called *Stock-jobbing*, or (as Mr. *Hutton* in his *Schoolmasters Guide*, justly remarks) the worst kind of Gaming.

## EXAMPLE 16.

What is the commission of £649 10s at £3  $\frac{1}{4}$  per Cent?

$$\begin{array}{r}
 \text{£ } s \\
 \frac{1}{4}) 649 \text{ } 10 \\
 \underline{\hspace{1.5cm}} \\
 1948 \text{ } 10 \\
 162 \text{ } 7 \text{ } 6 \\
 \hline
 \text{£ } 21 \text{ } 10 \text{ } 17 \text{ } 6 \\
 \begin{array}{l}

 4 \\
 \hline
 3 \mid 2
 \end{array}$$

## EXAMPLE 21.

What is the purchase of 12768 15 Bank Annuities at £84  $\frac{5}{8}$  per Cent?

The given rate wanting but £15  $\frac{3}{8}$  of being at *Par* or *Cent. per Cent.* therefore

$$\begin{array}{r}
 \text{From } \left\{ \begin{array}{l} \text{giv. sum } 12768 \text{ } 15 \text{ } - \\ \text{Dedt. } \left\{ \begin{array}{l} \text{Ans. to} \\ \text{exam. } 19 \text{ p. } 336 \text{ viz} \end{array} \right\} \end{array} \right. \left\{ \begin{array}{l} 1963 \text{ } 3 \text{ } 10 \frac{3}{4} \\ \hline \text{Rems. } \text{£ } 10805 \text{ } 11 \text{ } 1 \frac{1}{4} \end{array} \right\} \begin{array}{l} \text{the purch.} \\ \text{at} \end{array}
 \left\{ \begin{array}{l} \text{£ } 100 \\ 15 \frac{3}{8} \\ \hline 84 \frac{5}{8} \end{array} \right\} \begin{array}{l} \text{per Cent.} \end{array}$$

## PROMISCUOUS QUESTIONS.

## Question 1. by Mr. Clare.

Lent 109 Guineas at £4 per Cent. which by the 18th of August 1760, was raised by the interest to so many Moidores bating 2s 6d pray on what day did the bond bear date?

First 109 Guineas  $\left\{ \begin{array}{l} \text{£ } 114 \text{ } 9 = 114.45 \\ \text{and } 109 \text{ Moidores } \left\{ \begin{array}{l} 147 \text{ } 3 \end{array} \right. \end{array} \right.$  the Principal from which abate 2s 6d and the Amount is £147 -s 6d from which deduct the Principal, and the remainder will be £32 11s 6d = £32 575 the Interest.

Ff

Then

Then by Cor. 3. page 331.

114.45

.04

Years

4.578 ) 32.575 ( 7.11555 = 7 years and 42 days, the time the 109 guineas were out at interest, and which time the question says expired on the 18th *August*, 1760.—Now to 31 the number of days in the preceding month *July*, add the 18 days in *August*, and the sum will be 7 days more than 42, whereby it is plain that the bond was dated 7th *July* 1753, for from that time to 7th *July* 1760 are 7 years, and from 7th *July* 1760 to 18th *August* following are 42 days, which together make 7 years and 42 days, as above.

### Question 2. by Mr. James Hardy.

See (that excellent treatise) his Elements, or Theory of Arithmetic, page 303.

A man lent his friend £750 for one year; in the mean time being in want of cash, he disposed of some South-Sea Stock; upon going to replace it, found the market had rose, so that he was a loser of £27 14s 8d  $\frac{1}{4}$  which he resolved his friend should make good for the use of the money lent to him: It is required to find how much he was charged *per Cent. per Annum*?

$$\begin{array}{r} \text{£} \quad \text{s} \quad \text{d} \\ \text{First } 27 \quad 14 \quad 8 \frac{1}{4} \text{ (the Interest) } = 27.734375 \end{array}$$

Then by Cor. 4. page 332.

$$\begin{array}{r} \text{£} \quad \text{s} \quad \text{d} \\ 750 ) 27.734375 ( .03697916 \text{ Ratio} = 3 \quad 13 \quad 11 \frac{1}{2} \end{array}$$

the Rate required.

C O M-

---

---

## COMPOUND INTEREST.

**T**HIS rule compounded does appear,  
 Because the Int'rest ev'ry year  
 Is not receiv'd—but added to  
 The principal, 'till more is due.  
 This Int'rest upon Int'rest we  
 May truly call—but as you see  
 It is not lawful so to be. }

### R U L E.

The first year's Int'rest you must find,  
 In which the principal is join'd  
 Or added to, the sum will be,  
 A second principal you'll see ;  
 And thus you must advance on still  
 For any years, be what they will,  
 The given principal subtract,  
 From th' last amount to be exact;  
 And the remainder you will find,  
 Will give the Int'rest to your mind.

## EXAMPLE 1.

What is the Compound Interest of £268 forborn 3 years at £5 per Cent. per Annum?

Rem.  $11.055 = \text{£}11 \text{ 1s } 1\text{d}$  the Answer

The foregoing methods of working Compound Interest (tho' generally taught in schools) being rather tedious, I shall therefore shew the learner a much shorter method by the help of the two following tables,

TABLE I.

Years	The Amount of £1 at Comp. Int. for years.			
	$3\frac{1}{4}$ p. Cent.	4 p. Cent.	$4\frac{1}{2}$ p. Cent.	5 p. Cent.
1	1.035	1.04	1.045	1.05
2	1.071225	1.0816	1.092025	1.1025
3	1.1087178	1.124864	1.1411661	1.157625
4	1.147523	1.1698586	1.1925186	1.2155063
5	1.1876863	1.2166529	1.2461816	1.2762816
6	1.2292553	1.265319	1.3022601	1.3400956
7	1.2722792	1.3159318	1.3608618	1.4071004
8	1.316809	1.3685691	1.4221006	1.4774554
9	1.3628973	1.4233118	1.4860251	1.5513282
10	1.4105987	1.4802443	1.5529694	1.6288946
11	1.4599697	1.5394541	1.622853	1.7103393
12	1.5110686	1.6010322	1.6958814	1.7958563
13	1.563956	1.6650735	1.7721961	1.8856491
14	1.6186945	1.7316764	1.8519449	1.9799316

100	1.0094696	1.0108033	1.0121324	1.0134569
110	1.0104214	1.01189	1.0133537	1.0148125
120	1.0113742	1.0129779	1.0145765	1.0161699
130	1.0123279	1.0140670	1.0158007	1.0175291
140	1.0132825	1.0151572	1.0170265	1.0188902
150	1.0142379	1.0162487	1.0182537	1.0202531
160	1.0151943	1.0173412	1.0194824	1.0216178
170	1.0161516	1.018435	1.0207126	1.0229843
180	1.0171098	1.0195299	1.0219442	1.0243527
190	1.0180689	1.0206261	1.0231774	1.0257128
200	1.0190288	1.0217233	1.024412	1.0270949
210	1.0199897	1.0228218	1.0256481	1.0284687
220	1.0209315	1.0239215	1.0268858	1.0298444
230	1.0219142	1.0250223	1.0281249	1.0312219
240	1.0228778	1.0261243	1.0293655	1.0326013
250	1.0238424	1.0272275	1.0306076	1.0339825

The construction of *Table 1st.* is no more than involving the amount of £1 for a year, to the power of the number of years. Thus for 3 years  $1.05 \times 1.05 \times 1.05 = 1.157625$  as you'll find in the table under *£5 per Cent.*

*Table 2d.* is constructed by a continual multiplication of the amount of £1 for a day, (being the root of its amount for a year extracted to the 365th, power.)

The amount of £1 for a day at *£5 per Cent.* being 1.0001336 then  $1.0001336 \times 1.0001336 \times 1.0001336 = 1.0004011$  the amount of £1 at the same rate Compound Interest for 3 days.

### C O R O L L A R I E S.

*Cor. 1. When the principal, time and rate are given to find the amount.*—Multiply the amount of £1 found in the table, at the given rate and time, by the principal, and the product will be the answer.

*Cor. 2. When the rate, time and amount are given to find the principal.*—Divide the given amount, by the amount of £1 in the table at the given rate and time, and the quote will be the answer.

*Cor. 3. When the amount, rate, and principal are given to find the time.*—Divide the amount by the principal, the quote will be the amount of £1 at the given rate, which being found in one of the tables under that rate, will shew the time required.

*Cor. 4. When the amount, time, and principal are given to find the rate.*—Divide the amount by the principal, and the quote will be the amount of £1, which being found in the table even with the given time, will shew the rate required.

EXAM-

## EXAMPLE 4.

At three pound ten, \* come tell to me,  
 What th' 'mount of sixty pounds will be,  
 For twenty years, not more nor less,  
 Ingenious *Tyro* this exprefs.

By *Cor. 1* in the preceding page.

1.9897888 Tabular number against 20 years  
 60 at  $3\frac{1}{2}$  per Cent.

Ans. 119.387328 =  $\begin{matrix} \text{£} & \text{s} & \text{d} \\ 119 & 7 & 8\frac{1}{4} \end{matrix}$  the amt. required.

## EXAMPLE 5.

To what will £463 amount to, at  $L_4$  per Cent.  
*per Annum*, for 220 days, Compound Interest?

1.0239215 = Tab. number against 220 days  
 460 at 4 per Cent.

614352900  
40956860  
 Amt. 471.00389 =  $\begin{matrix} \text{£} & \text{s} & \text{d} \\ 471 & - & -\frac{3}{4} \end{matrix}$

## SCHOLIUM.

If you want to know the amount for a greater number of years or days than those in the tables.— Divide the given time into such parts as are in the tables, and the amounts answering thereto multiplied one into another continually, will produce the amount of / 1 for the given time, with which proceed as directed in *Cor. 1* in the preceding page.

---

\* *Per Cent.~per Annum.*

EXAM-

## EXAMPLE 6.

What is the amount of £50 10s for 64 years at £5 per Cent. per Annum, Compound Interest?

First 4.3219424 } the am. of £1 for { 30 } years at £5  
and 5.2533482 } { 34 } per Cent. as per table

Then per Scholium 4.3219424 multiplied (according to the contraction in page 287) by 5.2533482 produces 22.704669 the amount of £1 for 64 years at £5 per Cent. which amount being multiplied by the given principal viz. £50.5 will produce 1146.5857845 = £1146 11s 8d  $\frac{1}{2}$  the Answer.

## EXAMPLE 7.

What will £140 amount to in 167 days at £3 10s per Cent. per Annum, Compound Interest?

First 1.0151943 } the am. of £1 for { 160 } Days at £3  $\frac{1}{2}$  per Cent.  
and 1.00066 } { 7 } (as per table.

Then 1.0151943 multiplied by 1.00066 produces 1.0158643 &c. the amount of £1 for 167 days at £3  $\frac{1}{2}$  per Cent. which amount being multiplied by the principal £140, will produce 142.221002 = £142 4s 5d the Answer.

## EXAMPLE 8.

What is the present worth of £100 10s 10d  $\frac{1}{2}$  due 12 years hence, at £4  $\frac{1}{2}$  per Cent. per Annum, Compound Interest?

By Cor. 2, page 344.—Divide the given amount £100.54375 (according to the contraction in page 292) by 1.6958814 viz. the amount of £1 for 12 years, at £4  $\frac{1}{2}$  per Cent. as per table, and the quotient will be 59.287017 = £59 5s 8d  $\frac{3}{4}$  the Answer.

EXAM-

## EXAMPLE 9.

A grave old Batchelor of late,  
 Had left him as appears,  
 A Legacy \* by honest Kate,      \* of £800  
 T' receive in seven years, †      † and 89 days  
 And being aged as we find  
 Just three score years and one,  
 To sell the sum, he was inclin'd  
 Unto his neighbour John ;  
 What was the present worth I say,  
 Of this said Legacy ?  
 That John must to the old man pay ‡  
 Come tell me instantly.

First -  $1.4071004$  }  $\frac{5}{100}$  for  $\left\{ \begin{array}{l} 7 \text{ years} \\ 80 \\ 9 \end{array} \right\}$  } at £5 per Cent. as  
 and  $\left\{ \begin{array}{l} 1.0107511 \\ 1.0012037 \end{array} \right\}$  }  $\frac{1}{100}$  for  $\left\{ \begin{array}{l} 80 \\ 9 \end{array} \right\}$  } } (per table.

Then per Scholium page 345,  $1.4071004$  multiplied (according to the contraction in page 287) by  $1.0107511$  produces  $1.4222283$  (the amount of £1 for 7 years and 80 days at £5 per Cent.) which being multiplied (according to the said contraction) by  $1.0012037$  produces  $1.4239402$  (the amount of £1 for the given time and rate) by which dividing the given legacy or amount, viz. £800 quotes  $561.821 = £561 \text{ } 16s \text{ } 5d$  the Answer.

## EXAMPLE 10.

In what time will £300 amount to £373 17s 1d at £4  $\frac{1}{2}$  per Cent. per Annum. Compound Interest ?

$$3|00) 3|73.85416$$

By Cor. 3 page 344.

1.24 61805 the amount of £1 for the required time, which amount being found under £4  $\frac{1}{2}$  per Cent. in the table shews 5 years to be the time required.

‡ Allowing 5 per Cent. per Annum, Compd. Interest.

EXAM-

## EXAMPLE 11.

How long must £1000 be out at Compound Interest before it amounts to £1400 5s 6d at £4 *per Cent. per Annum*?

1000) 1400.275 (1.400275 the amount of £1 for the required time, which amount not being in either of the two tables, therefore seek the next less thereto which you will find in table 1 under £4 *per Cent.* to be 1.3685691 *viz.* the amount of £1 for 8 years at the given rate, by which amount divide the number sought, *viz.* 1.400275 (according to the *contraction* in page 292) and the quotient will be 1.0231672, the nearest less number to which in the second table under the same rate is 1.0228218 answering to 210 days, then divide 1.0231672 (according to the said *contraction*) by 1.0228218 (the amount of £1 for 210 days at the given rate) and the quotient will be 1.0003377 which answers in the table *nearly* to 3 days, whence the answer is 8 years and 213 days.

## EXAMPLE 12.

At what rate *per Cent. per Annum* Compound Interest will £60 amount to £119 7s 9d in 20 years?

60) 119.3875

By Cor. 4 page 344.

1.9897916 the amount of £1 for 20 years, which (in the table) corresponds with £3  $\frac{1}{2}$  *per cent* the answer.

## SCHOLIUM.

Having now given sufficient examples to explain the use and excellence of the two preceding tables, I shall in the next place give a few examples relating to *Freehold or Real Estates*, and then proceed to *Rebate or Discount*.

EXAM-

## EXAMPLE 13.

Suppose a Gentleman had £6000 in ready money, and was desirous to lay it out in the purchase of a Freehold Estate, and to be allowed £4 *per Cent.* for his money Compound Interest. What must be the annual Rent of such an Estate or purchase?

$$\begin{array}{cccc} \text{£} & \text{£} & \text{£} & \text{£} \\ \text{As } 100 & : & 4 & :: 6000 : 240 \text{ the Answer.} \end{array}$$

## EXAMPLE 14.

Suppose a Freehold Estate of £240 *per Annum* was to be sold, and the purchaser to be allow'd £4 *per Cent.* Compound Interest. What wou'd be the purchase money and how many years purchase must the Estate be sold for?

$$\begin{array}{cccc} \text{£} & \text{£} & \text{£} & \text{£} \\ \text{First As } 4 & : & 100 & :: 240 : 6000 \text{ the purchase money} \end{array}$$

$$\begin{array}{l} \text{Or (without knowing} \\ \text{the purchase money} \\ \text{or yearly Rent)} \end{array} \left. \begin{array}{l} \text{Then As } \text{£} 240 \\ \text{As } 4 \end{array} \right\} : \begin{array}{l} \text{year.} \\ 1 \end{array} :: \left\{ \begin{array}{l} 6000 \\ 100 \end{array} \right\} \begin{array}{l} \text{the No.} \\ \text{of years} \\ \text{purchase} \end{array}$$

by which multiply the annual Rent *viz.* £240, and the product will be £6000 the purchase money, as before.

## EXAMPLE 15.

Suppose a Gentleman bought a Freehold Estate of £240 *per Annum* for £6000, what rate of Compound Interest was he allow'd?

$$\begin{array}{cccc} \text{£} & \text{£} & \text{£} & \text{£} \\ \text{As } 6000 & : & 240 & :: 100 : 4 \text{ the Answer.} \end{array}$$

G 8 Or

Or (without knowing the annual Rent or purchase money) As 25 (the number of years purchase found in the preceding example) : £100 :: 1 year : £4 the rate the same as in the preceding page.

*Note.* When Freehold Estates are to be sold or purchased in reversion, the following examples will sufficiently determine an explanation.

## EXAMPLE 16.

Suppose the reversion of a Freehold Estate of £240 *per Annum* to commence 10 years hence was to be sold, what is it worth allowing the purchaser £4 *per Cent.* Compound Interest for his money?

*First* (by example 14 page 349) As £4 : £100 :: £240 : £6000. Then (per Cor. 2 page 344) divide £6000 (according to the contraction in page 292) by 1.4802443 *viz.* the amount of £1 for 10 years at £4 *per Cent.* (as per table) and the quotient will be 4053.38497 &c = £4053 7s 8d  $\frac{1}{4}$  the answer.

## EXAMPLE 17.

If the reversion of a Freehold Estate to commence 10 years hence, be sold for £4053 7s 8d  $\frac{1}{4}$  and the purchaser be allow'd £4 *per Cent.* Compound Interest for his money, what is the yearly Rent of the Estate?

*First* (by Cor. 1 page 344) 1.4802443 *viz.* the amount of £1 for 10 years at £4 *per Cent.* as per table, multiplied (according to the contraction in page 287) by 4053.38497 &c. produces £6000. Then (per example 13 page 349) As £100 : £4 :: £6000 : £240 the annual Rent required.

## REBATE, or DISCOUNT.

**R**EBATE discovers to your view,  
The difference 'twixt a sum that's due,  
At any certain time to come,  
And th' present worth of such a sum  
Or debt, that shall contracted be,  
As by the following rule you'll see.

### R U L E,

Th' amount of just one hundred pound,  
For th' time, and rate, must first be found;  
Then as that sum's to th' int'rest \* net, \* or £100  
So is the given sum, or debt,  
To th' present worth, or Discount true,  
Of th' given sum that shall be due.

### EXAMPLE 1.

What is the Discount of £1000 for 10 months, at  
£4 per Cent. per Annum?

Mo.	£				
6	$\frac{1}{2}$	4.	Rate	per	Cent.
4	$\frac{1}{3}$				
To	2.				
Add	1.3333				
And to	3.3333				
Add	100.				

Principal

As £103.3333 : 3.3333 :: 1000 : 32.258 = £ 32 5 1 $\frac{1}{2}$   
(the Answer.)

## EXAMPLE 2.

What is the present worth of a £40 note, due 15 months hence, Discount at £5 per Cent. per Annum.

$$\begin{array}{r}
 \text{£} \\
 \frac{3}{4} \overline{) 5} \\
 \underline{1.25} \\
 \text{To } 6.25 \\
 \text{Add 100.} \quad \text{Principal}
 \end{array}
 \left. \vphantom{\begin{array}{r} \text{£} \\ \frac{3}{4} \overline{) 5} \\ \underline{1.25} \\ \text{To } 6.25 \\ \text{Add 100.} \end{array}} \right\} \text{the Interest of } 100 \text{ for } \left\{ \begin{array}{l} 12 \\ 3 \\ 15 \end{array} \right\} \text{ Mths.}$$

$$\begin{array}{r}
 \text{As } \text{£}106.25 : 100 :: 40 : 37.647 \&c. = 37 \text{ } 12 \text{ } 11 \frac{1}{4} \\
 \text{(the Answer.}
 \end{array}$$

Or, by Cor. 2. in Simple Interest, page 331.

First  $1.25 \times .05 \div 1 = 1.0625$  Then divide £40 by 1.0625, and the quotient will be 37.647 &c. = £37 12s 11d  $\frac{1}{4}$  the Answer, the same as above.

## EXAMPLE 3.

Admit I pay £37 12s 11d  $\frac{1}{4}$  for a Note due 15 months hence, and am allow'd £5 per Cent. Discount. Quere the value of the Note.

The amount of the present worth is the sum to be discounted, therefore  $\text{£}37 \text{ } 12 \text{ } 11 \text{d } \frac{1}{4} = 37.646875 \times .05 \times 1.25 = 2.3529 \&c.$  the Interest of the present worth, or the Rebate of the value of the Note, to which Interest or Rebate add 37.646875 the present worth, and the sum will be 39.999 &c. = £40 nearly the value required.

EXAM-

**EXAMPLE 4.**

Suppose I had a Legacy  
Of forty pounds in cash,  
Due at a certain time to come,  
And sell to Toby Flash  
The same, for what is here subjoin'd \*  
Th' executor t' allow †  
When must the Legacy be paid  
Without Rebate tell now ?

£ s d  
37 12 11½  
† £5 per cent

*Solution by Cor. 3 in Simple Interest page 331.*

	£	s	d		£	
From	40	—	—	}	=	{ 40.
Ded.	37	12	11½	}	=	{ 37.646875
						{ Legacy
						{ Pr. worth
						{
						{ Rebate

37.6468 &c. x .05 = 1.88234 &c. ) 2.353125

Quote 1.25 = 1½ Year, or 15 Months the Answer.

**EXAMPLE 5.**

Admit a Note or Legacy of £40 payable at 15 months, hence, be sold for £37 12s 11d½ present payment. At what rate *per Cent*, was it sold for ?

*Solution by Cor. 4 in Simple Interest page 332.*

First £37 12s 11d½ (the present worth) = 37.646875 which deduct from £40 (the note or legacy) and the remainder will be 2.353125 the Rebate. Then divide 2.353125 by 47.0585 &c. viz. the product arising from 37.646 &c. being multiplied by 1.25 (the time) and the quotient will be £.05 the ratio = £5. the rate required.

*Solution by Cor. 2 in Simple Interest page 331.*

yrs.	yrs.	yrs.
3 mo. = .25	5 mo = .4166	8 mo. = .6666.
.06	.06	.06
Prod. .015	Prod. .025	Prod. .04

The proper divisors being found, by adding 1 to each of the above products, proceed thus

$$1.015)50.00(49.261$$

$$1.025)50.00(48.7804$$

$$1.04)20.00(19.2307$$

$$\text{£ } 117.2721 = 117 \text{ } 5 \text{ } 5\frac{1}{4} \text{ Answer.}$$

## EQUATION of PAYMENTS.

**O**BSEERVE me *Tyra*, now you'll see  
 Debtor and creditor agree,  
 When sev'ral debts are to be paid,  
 At diff'rent times, but after made  
 An Equal Payment of the whole,  
 Without sustaining loss—*per rule.*

### R U L E.

Each Payment multiply I say,  
 By th' time its due, and then you may  
 Divide the sum of th' products by  
 The sum of th' Payments, you'll espy.  
 Th' equated time, the whole's to be  
 Paid without loss, as here you'll see.

**EXAM-**

## EXAMPLE 1.

Simon owes Andrew £80 which was to be paid £40 at 3 months and £40 at 7 months, but they agree to reduce the whole to one Payment. *Quere* the equated time?

$$\begin{array}{rcl} \text{£} & \text{mo.} & \text{£} \\ 40 \times 3 & = & 120 \\ 40 \times 7 & = & 280 \end{array}$$

$$\begin{array}{r} 8|0)40|0 \\ \hline \end{array}$$

Ans. 5 months.

## EXAMPLE 2.

Hugh is indebted to Cornelius £1000 which is to be discharged thus, viz. £200 present, £600 at 5 years end, and the remainder at the end of 8 years. *Quere* the equated time of Payment?

$$\begin{array}{rcl} \text{£} & \text{yrs.} & \text{£} \\ 600 \times \left\{ \begin{array}{l} 5 \\ 8 \end{array} \right\} & = & 3000 \\ 200 \times \left\{ \begin{array}{l} 5 \\ 8 \end{array} \right\} & = & 1600 \end{array}$$

$$\begin{array}{r} 1000)4600 \\ \hline \end{array}$$

Ans. 4.6 years

## EXAMPLE 3.

A Gentleman being desirous of making a Purchase, borrows of a friend £460 which by agreement was to be repaid at the end of 6 months, but the Gentleman finding he had more cash than was needful for the above mentioned purpose, would remit back to his friend £160 provided he would allow him a longer time for the Payment of the remainder, which being agreed upon, the time of Payment is required?

$$\begin{array}{rcl} \text{£} & \text{£} & \\ \text{From } 460 & 460 & \\ \text{Take } 160 & 160 & \\ \hline & 300 & \end{array}$$

$$\begin{array}{r} 300)276|00 \\ \hline \end{array}$$

Answer 9.2 months.

## EXAMPLE

## EXAMPLE 4.

An honest Man agrees to pay  
 One hundred Pounds a certain way,  
 One fourth in hand, and as we find,  
 The same each three months to his mind  
 Until the whole's discharged fair,  
 What is th' equated time ? declare.

$$\begin{array}{r} \text{mo.} \quad \text{£} \\ \text{£} \quad 25 \times \left\{ \begin{array}{l} 3 \\ 6 \\ 9 \end{array} \right\} = \left\{ \begin{array}{l} 75 \\ 150 \\ 225 \end{array} \right\} \\ \hline 100 \overline{)450} \end{array}$$

Ans.  $4.5 = 4\frac{1}{2}$  months

## COROLLARY.

When Rebate is to be made at so much per Cent. per Annum. — Find the present worth of each Payment for its respective time, the sum of which present worths deduct from the whole sum or debt and the remainder will be the Rebate or Discount thereof, and then by proceeding according to Cor. 3 in Simple Interest page 334, the true equated time will be easily known.

## EXAMPLE 5.

Job owes Moses £200 which by agreement was to be paid as follows, viz. £80 at 4 months, £70 at 6 months, and the remaining £50 at the end of 9 months; but

but they agree to have but one Payment of the whole.  
*Quere* the true equated time, Rebate being made at  
 £4 per Cent. per Annum?

The present worth of	$\left. \begin{array}{r} 80 \\ 70 \\ 50 \end{array} \right\} \text{at } 4 \text{ per}$	Mths. hence will be easily found by the rule in p. 351 & by Cor. 2	$\left. \begin{array}{r} 78.9473 \\ 68.6274 \\ 48.5436 \end{array} \right\}$

The present worth of £200, 196.1183  
 (payable as above)

From 200.  
 Take 196.1183

$$196.1183 \times .04 = 7.844732 \quad 3.8817 \text{ Rebate}$$

Quote .4948 Parts of a  
 year = 5 months 3 weeks and  
 5 days the Answer.

### SCHOLIUM.

I might in this place introduce various other rules  
 by different authors (who have endeavoured to make  
 improvements on this common method, as given by  
 Gocker,) some of which are Mr. John Kersey, Mr.  
 Hatton, Sir Samuel Moreland, Mr. Ward, Mr. Mal-  
 colm; &c. but must beg to be excused as room will not  
 permit them, and the common method being more  
 adapted to practice, and what is generally taught in  
 schools, and is near enough the truth in common af-  
 fairs. Mr. Malcolm's rule is the only true one, but  
 very operose when the payments are to be made at  
 different times. — This Gentleman, after putting  $\frac{1}{2}$  for  
 the

the first Payment,  $t$  the distance of its term of Payment;  $D$  the last payable Debt, and  $T$  the distance of its Term, and  $r$  the rate of one year's Interest for £1, and  $x$  = the distance of the equated Time; proceeds by an *algebraic* way of reasoning founded on the principles of *Simple Interest*, brings out  $T + t + \frac{D + d}{dr}$  which he calls the first Number found,

and  $\frac{DT + dt}{dr} + Tt$  the second Number found, which two Numbers are called  $a$  and  $s$ , then (he says)

$$ax - x^2 = s, \text{ whence } x = \frac{a + \sqrt{a^2 - 4s}}{2} \text{ the pre-}$$

sent rule or equated time for any two Payments.

The ingenious Mr. *Hutton* makes mention of the above rule in page 88 of his *Arithmetic*, but his examples are all worked by the common method.

## PROMISCUOUS QUESTIONS.

Question 1. by Mr. *John Hampson*

at *Bedford-Mill*, near *Leigh*, *Lancashire*.

From *Palladium*, 1753.

My Son having gone a considerable time to *Leigh School* at 1s 6d by the quarter, to read *English*, which commenced on the 14th of *January*, 1752: I agreeing with Mr. *Henry Arrowsmith*, the Master of the School, to pay him 4s by the quarter, for his writing my Son a copy or two each day besides; but he not beginning to write 'till the 19th, I would have  
you

you (*Palladium Arithmeticians*) shew the exact time when 4s become due to the Master?

*First* to 30 the Days in the Month, add 5 the number of Days from *January* 14th, to the time he began to write, and the Sum will be 35, *Then per Rule p. 355.*

$$18 \times 30 = 540$$

$$35 \times 30 = 1050$$

$$\begin{array}{r} s \quad d \quad \text{---} \\ \end{array}$$

4 = 48) 1590 ( $33\frac{6}{8} = 33\frac{3}{4}$  from which deduct 30 and there will remain  $3\frac{3}{4}$  Days the exact time to be added to the quarter.

*Note.* It matters not whether you take 29, 30, or 31 days to a month, the Answer is the same, as *Mr. Hampson* justly remarks.

Question 2. by the late *Thomas Dod, Esq;*  
of *Edge, near Malpas, Cheshire.*

*Ladies Diary, 1720.*

At *Michaelmas*, seventeen hundred nineteen,  
My writings will shew, (which are yet to be seen)  
That to me were three hundred and twenty pounds due,  
And half of that sum besides forty two viz. £.202.  
Just five years after I then might demand, (hand;  
But wou'd fain have the whole somewhat sooner in  
I agree to rebate for the latter sum, too  
The same rate (simple Interest) our statutes allow,  
But then I expect some use will accrue  
From my sixteen score pounds, that last year were due.  
Now to know on what day I shall be very fond,  
To receive my five hundred and twenty-two pound?

*Solution*, by *Mr. Malcolm's Rule*, given in this Treatise, in the preceding page.

*First*, to £320 add £.202 and divide the Sum by £.16 (a year's interest of the £320) and the quotient will be 32.625 which add to 5 and the sum will be 37.625 which (as the £320 was to be paid down) is the

the first number. *Secondly*, multiply 202 by 5 and divide the product by 16 and the quotient will be 63.125 the second number. *Then*, from 1415.640625 the square of 37.625 the first number, deduct 252.5 viz. 4 times 63.125 the second number, and the remainder will be 1163.140625, the square root whereof is 34.1048 which deduct from 37.625 (the first number) and the remainder will be 3.5202, one half of which is 1.7601 = 1 year and 277 days the true equated time, and which answers to July 4th, 1721.

---

## SINGLE FELLOWSHIP.

**B**Y Fellowship, you'll quickly find,  
How Stocks in partnership combin'd  
Are calculated just and true,  
And each receive his proper due.

### R U L E

Say, by the *Golden Rule of Three*,  
As the whole Stock, whate'er it be,  
Is to each partner's loss or gain,  
So is his Stock 'tis very plain ;  
To his partic'lar share you'll find  
Of loss or gain in comp'ny join'd.

## EXAMPLE I.

Two partners, *John* and *Thomas*, make a stock of £240; *John* puts in £110, and *Thomas* £130, by which they gain in trade £80. What is each man's share?

$$\begin{array}{r}
 \text{First to } \overset{\text{£}}{110} \text{ John's} \\
 \text{Add } \overset{\text{£}}{130} \text{ Thomas's} \quad \left. \vphantom{\begin{array}{l} \text{First to } \overset{\text{£}}{110} \text{ John's} \\ \text{Add } \overset{\text{£}}{130} \text{ Thomas's} \end{array}} \right\} \text{Stock} \\
 \hline
 \text{Then As } 240 : 80 :: \left\{ \begin{array}{l} \overset{\text{£}}{110} \\ \overset{\text{£}}{130} \end{array} \right\} : \left\{ \begin{array}{l} \overset{\text{£}}{36} \overset{\text{s}}{13} \overset{\text{d}}{4} \text{ John's} \\ \overset{\text{£}}{43} \overset{\text{s}}{6} \overset{\text{d}}{8} \text{ Thomas's} \end{array} \right\} \left. \vphantom{\begin{array}{l} \overset{\text{£}}{36} \overset{\text{s}}{13} \overset{\text{d}}{4} \text{ John's} \\ \overset{\text{£}}{43} \overset{\text{s}}{6} \overset{\text{d}}{8} \text{ Thomas's} \end{array}} \right\} \begin{array}{l} \text{share} \\ \text{of the} \\ \text{gain.} \end{array}
 \end{array}$$

Proof £80

## EXAMPLE 2.

Two merchants *A* and *B* make a stock, *A* puts in £250 and *B* £150 they trade and gain £300 which by agreement is to be so divided that *A* may have £6 per Cent. and *B* £4½. What must each have of the gain?

$$\begin{array}{r}
 \text{The Int. of } \left\{ \begin{array}{l} \overset{\text{£}}{250} \text{ A's} \\ \overset{\text{£}}{150} \text{ B's} \end{array} \right\} \begin{array}{l} \overset{\text{£}}{6} \\ \overset{\text{£}}{4\frac{1}{2}} \end{array} \begin{array}{l} \overset{\text{£}}{15} \\ \overset{\text{£}}{6} \end{array} \begin{array}{l} \overset{\text{s}}{—} \\ \overset{\text{s}}{15} \end{array} \\
 \hline
 \text{Sum } 21 \overset{\text{s}}{15} \\
 \hline
 \text{As } \overset{\text{£}}{21} \overset{\text{s}}{15} : 300 :: \left\{ \begin{array}{l} \overset{\text{£}}{15} \overset{\text{s}}{—} \\ \overset{\text{£}}{6} \overset{\text{s}}{15} \end{array} \right\} : \left\{ \begin{array}{l} \overset{\text{£}}{206} \overset{\text{s}}{17} \overset{\text{d}}{11} - \frac{20}{19} \text{ A's} \\ \overset{\text{£}}{93} \overset{\text{s}}{2} - \frac{1}{4} \frac{9}{19} \text{ B's} \end{array} \right\} \begin{array}{l} \text{share} \\ \text{of the} \\ \text{gain.} \end{array}
 \end{array}$$

Proof £300

COROL-

Carousing and singing they past the long day,  
 No sons of great *Bacchus* more jovial than they.  
 At last for the reck'ning the Tanners did call,  
 Whilst some of the Coblers did nothing but bawl  
 For old *Hock*, or *Stingo*—the Landlord came in  
 With his scores round a trencher—to work did begin,  
 And found that ten pounds was the shot to defray,  
 Then tell to me *Tyro* what each had to pay,  
 When the Tanners and th' others agreed very true,  
 In proportion to pay, as five, four, three and two?

It is evident by the question that as oft as each Tanner paid 5s, the others paid 4s, 3s, and 2s a piece, which sum multiply by the number of each trade, or occupation.

$$\begin{array}{r}
 \begin{array}{c} s \\ 6 \\ 8 \\ 16 \\ 21 \end{array} \times \begin{array}{c} s \\ 5 \\ 4 \\ 3 \\ 2 \end{array} = \begin{array}{c} s \\ 30 \\ 32 \\ 48 \\ 42 \end{array} = \begin{array}{c} L \\ 1.5 \\ 1.6 \\ 2.4 \\ 2.1 \end{array} \\
 \hline
 152
 \end{array}$$

Per Cor. in the preceding page.  
 7.6)10.0(1.31578  
 Com. Multiplier.

$$1.31578 \times \begin{array}{c} L \\ 1.5 \\ 1.6 \\ 2.4 \\ 2.1 \end{array} = \begin{array}{c} L \\ 1.97367 \\ 2.105248 \\ 3.157872 \\ 2.763138 \end{array} = \begin{array}{c} s \\ 6 \\ 8 \\ 16 \\ 21 \end{array} \left\{ \begin{array}{l} \text{Tanners} \\ \text{Curriers} \\ \text{Cordwainers} \\ \text{Coblers} \end{array} \right\} \text{Share.}$$

$$\begin{array}{c} L \\ 6)1.97367(.328945) \\ 8)2.105248(.263156) \\ 16)3.157872(.197367) \\ 21)2.763138(.131578) \end{array} = \begin{array}{c} L \\ 6 \\ 5 \\ 3 \\ 2 \end{array} \begin{array}{c} s \\ 6\frac{3}{4}+ \\ 3+ \\ 11\frac{1}{4}+ \\ 7\frac{1}{4}+ \end{array} \left\{ \begin{array}{l} \text{Tanner's} \\ \text{Currier's} \\ \text{Cordwainer's} \\ \text{Cobler's} \end{array} \right\} \text{Share.}$$

EXAM-

## EXAMPLE 5.

An Usurer dying, left the whole of his Fortune to be disposed of in the following manner: To  $A \frac{2}{3}$ , to  $B \frac{3}{8}$ , to  $C \frac{1}{4}$ , to  $D \frac{1}{10}$ , to  $E \frac{1}{20}$ , and to  $F \frac{1}{50}$ , and the remainder which was £800 to  $C$  (over and above his  $\frac{1}{4}$ ). What was the whole Sum left, and each one's Share thereof?

$\left. \begin{array}{r} \frac{2}{3} \\ \frac{3}{8} \\ \frac{1}{4} \\ \frac{1}{10} \\ \frac{1}{20} \\ \frac{1}{50} \end{array} \right\} = \left\{ \begin{array}{l} .4 \\ .3 \\ .125 \\ .05 \\ .025 \\ .02 \end{array} \right\}$	$\left. \begin{array}{l} .4 \\ .3 \\ .125 \\ .05 \\ .025 \\ .02 \end{array} \right\} \text{Parts of } £1.$	$\begin{array}{r} \text{From } £ \\ \text{Take } .92 \\ \hline .08 \end{array}$	$\begin{array}{r} £ \\ .08 \overline{) 800.00} \\ \hline \end{array}$	$\begin{array}{r} £10000 \text{ the whole} \\ \hline \text{Sum left.} \end{array}$
$\text{Sum } .92$				
$\begin{array}{l} £10000 \text{ mult. by } \left\{ \begin{array}{l} .4 \\ .3 \\ .125 \end{array} \right\} = \left\{ \begin{array}{l} 4000 \text{ A's} \\ 3000 \text{ B's} \\ 1250 \text{ C's} \end{array} \right\} \\ \\ £10000 \text{ mult. by } \left\{ \begin{array}{l} .05 \\ .025 \\ .02 \end{array} \right\} = \left\{ \begin{array}{l} 500 \text{ D's} \\ 250 \text{ E's} \\ 200 \text{ F's} \end{array} \right\} \end{array}$				
$\text{Proof } £10000$				

Or thus.

The shares or fractions in  $\frac{2}{3}$ ,  $\frac{3}{8}$ ,  $\frac{1}{4}$ , and  $\frac{1}{10}$ , reduced to a (by the note to case 9 page 251),  $\frac{100}{1000}$ ,  $\frac{375}{1000}$ , and  $\frac{250}{1000}$ , whereby divided into 200 equal parts, w  $C$ 's 25, (exclusive of his £800), which being added together & deducted from  $\frac{2000}{1000}$  or the whole equal (by the question) to £80

H h 3

bc

be  $\frac{200}{18} = \text{£} 50$  which multiplied severally by 200, 80, 60, 25, 10, 5 and 4, and adding the  $\text{£} 800$  to the product had by multiplying by 25, will produce the whole Sum left, and each one's respective Share thereof, the same as in the preceding page.

*Note.* The above Question I propos'd in *Owen's Magazine* for *December 1764*, from whence *Mr. Birks* copied it into his *Arithmetic*, page 594.

### EXAMPLE 6.

A Miser left his servant *Joe*,  
 One hundredth of his store,  
 Which made the rustic's bosom glow,  
 When counting of it o'er.  
 Then with one twentieth of his chink,  
 To landlord *Belch* he goes,  
 And with a *Tinker* sits to drink,  
 And his dear blooming *Rose*.  
 He lent the *Tinker* from this Sum,  
 Two tenths, it was no more,  
 Three fifths he paid the Tapster *Tom*,  
 Before he went on score;  
 One fortieth gave a Fidler *plus*,  
 To play a merry tune,  
 Three sixtieths *Nan* to have a buss,  
 At four i'th' afternoon.  
 Then half a crown he gave his *Fair*,  
 To pay for cakes and spice,  
 Who dainty cordials does prepare,  
 She being so very nice.  
 Three eightieths of his legacy,  
 He left with *Belch* on score;  
 So *Tyro* now display your art,  
 And ev'ry Sum explore?

*First*

First  $\frac{2}{10} = \frac{1}{5}$ , and  $\frac{3}{60} = \frac{1}{20}$  Then the fractions  $\frac{1}{5}$ ,  $\frac{3}{20}$ ,  $\frac{1}{40}$  and  $\frac{1}{20}$  added together make  $\frac{7}{40}$  which by the question is equivalent to all the money Joe took with him except the half crown he gave his Fair, therefore it is very plain that half a crown must be the remaining  $\frac{1}{8}$ , consequently 8 half crowns = £1 was the money he took with him,  $\frac{2}{10}$  or  $\frac{1}{5}$  whereof = 4s he lent the Tinker,  $\frac{3}{20} = 12s$  he paid the Tapster,  $\frac{1}{40} = 6d$  he gave the Fidler, and  $\frac{3}{60}$  or  $\frac{1}{20} = 1s$  he gave to Nan, which several Sums added to the half crown he gave his Fair make £1 (as before) which being the  $\frac{1}{20}$  of his Legacy, therefore the whole Legacy must be £20,  $\frac{3}{80}$  of which = 15s he left on score, and the whole Legacy being  $\frac{1}{100}$  of the Miser's Store (as per question) therefore  $20 \times 100 = £2000$  was the Miser's whole Estate.

## PROMISCUOUS QUESTIONS.

## Question 1. by Mr. Jeake.

It is proposed to divide £300 among 3 persons so that A gets £6 more than  $\frac{1}{4}$ , B £12 more than  $\frac{1}{3}$ , and C £8 less than  $\frac{2}{3}$ . What is the equal Share of each?

	$\pounds$		$\pounds$		$\pounds$
	To 150	the $\left\{ \begin{smallmatrix} \frac{1}{4} \\ \frac{1}{3} \\ \frac{2}{3} \end{smallmatrix} \right\}$ of £300		the $\left\{ \begin{smallmatrix} \text{add 6} \\ \text{add 12} \\ \text{take 8} \end{smallmatrix} \right\}$ due	Sum } $\pounds$ 156 Sum } 112 Rem. } 192
and	to 100				
	from 200				

Total £460 but

the Sum propos'd to be divided is only £300  
therefore

	$\pounds$	$\pounds$	$\pounds$	$s$	$d$	
As 460:300::	$\left\{ \begin{smallmatrix} 156 \\ 112 \\ 192 \end{smallmatrix} \right\}$	:	$\left\{ \begin{smallmatrix} 101 & 14 & 9 & \frac{1}{4} & \frac{1}{3} \\ 73 & 4 & 10 & \frac{1}{4} & \frac{1}{3} \\ 125 & - & 4 & - & \frac{1}{3} \end{smallmatrix} \right\}$			A's } B's } C's } Share

Quef-

## Question 2.

From the Town and Country Magazine for April 1769.

Five Weavers, four Taylors, and three Millers, drank to the value of £5 which they agreed to pay in the following manner, *viz.*  $\frac{2}{7}$  of what the Weavers paid should be equal to  $\frac{1}{4}$  of what the Taylors paid, and  $\frac{1}{6}$  of what the Taylors paid should be equal to  $\frac{1}{3}$  of what the Millers paid. *Quere*, what did the men of each Trade pay? £

then (*per Qu.*)  $\frac{£}{\frac{2}{7}}$  Suppose 1 to be the { Weavers }  
and  $\frac{1}{6}$  of  $\frac{16}{33}$  divided by  $\left\{ \frac{7}{8} \right\} = \left\{ \frac{16}{33} \right\}$  will be the { Taylors }  
Share. { Millers }

The sum of which shares is £  $1 \frac{10}{11} = \frac{610}{11}$  but the Sum spent was £5, therefore

As  $\frac{£}{\frac{610}{11}} : 5 :: \left\{ \begin{matrix} £ \\ \frac{16}{33} \end{matrix} \right\} : \left\{ \begin{matrix} £ & s & d \\ 2 & 10 & 10\frac{1}{2} & \frac{402}{619} \\ 1 & 3 & 3 & \frac{396}{619} \\ 1 & 5 & 10 & \frac{440}{619} \end{matrix} \right\}$  the { Weavers }  
true { Taylors }  
Share. { Millers }

Proof £5 — — the Sum spent.

## Question 3. by Mr. Richard Cor.

There is in a Cathedral Church, 20 Canons and 30 Vicars, and they spend in a year £2600, but every Canon must have 5 times as much as a Vicar. How much is each man's yearly Income?

First,  $20 \times 5 = 100$ , and  $100 + 30 = 130$ . Then

As  $\frac{£}{130} : \frac{£}{2600} :: \left\{ \begin{matrix} £ \\ 100 \\ 30 \end{matrix} \right\} : \left\{ \begin{matrix} £ \\ 2000 \\ 600 \end{matrix} \right\}$  for the { 20 Canons }  
{ 30 Vicars }

$\frac{£}{20} \frac{£}{2000} \left( \frac{£}{100} \right)$   
 $\frac{£}{30} \frac{£}{600} \left( \frac{£}{20} \right)$  the yearly income of each { Canon }  
{ Vicar }

D O U.

---

---

## DOUBLE FELLOWSHIP.

**T**HIS Rule determines very fair,  
 At diff'rent times each partner's Share  
 How each one finds his loss or gain,  
 As underneath I shall explain.

### R U L E.

Each partner's Stock first multiply  
 By th' time he does the same employ ;  
 Then as th' Sum of these products be,  
 To the whole gain or loss you'll see,  
 So is each of these products true,  
 To each man's gain, or loss in view.

### EXAMPLE I.

Two Partners *A* and *B* enter into partnership, *A* puts in £80 for 7 months, and *B* £90 for 5 months, they traffic and gain £40. How must it be divided between them ?

First,  $80 \times 7 = 560$  the product of *A*'s stock & time.  
 and  $90 \times 5 = 450$

Sum 1010

Then as 1010 : 40 ::  $\frac{560}{450}$  :  $\frac{22 \ 3 \ 6\frac{1}{4} \ 9}{17 \ 16 \ 5 \ 101}$  *A*'s share of the gain.  
*B*'s share of the gain.

Proof £40 — —

EXAM-

## EXAMPLE 2.

Three Butchers whose names we'll call *A*, *B* and *C*,  
 To hire a lea pasture together agree,  
 Just forty bright guineas *per annum* to pay,  
 To feed their cows jointly, as under we'll say ;  
*A* put in eight cows four months to a day,  
 And *B* put in ten cows three months and no more,  
 And *C* five for twelve months, then *Tyro* explore  
 What each of the annual Rent had to pay,  
 Come dome this quickly no longer delay ?

First  $\left\{ \begin{smallmatrix} 8 \\ 10 \\ 5 \end{smallmatrix} \right\} \times \left\{ \begin{smallmatrix} 4 \\ 3 \\ 12 \end{smallmatrix} \right\} = \left\{ \begin{smallmatrix} 32 \\ 30 \\ 60 \end{smallmatrix} \right\}$  the prod<sup>s</sup> of  $\left\{ \begin{smallmatrix} A's \\ B's \\ C's \end{smallmatrix} \right\}$  Stock and Time.

Sum 122

Then As 122 : 42 ::  $\left\{ \begin{smallmatrix} 32 \\ 30 \\ 60 \end{smallmatrix} \right\} : \left\{ \begin{smallmatrix} 11 \frac{1}{4} & 3 \frac{3}{4} & 4 \frac{5}{8} & A's \\ 10 & 6 & 6 \frac{1}{2} & 4 \frac{6}{8} & B's \\ 20 & 13 & 1 \frac{1}{4} & 1 \frac{1}{8} & 6's \end{smallmatrix} \right\}$  Part of the Rent.

Proof £42 — —

*Note.* The Product of *C*'s Stock and Time being exactly double to *B*'s, makes *C* to pay exactly twice as much as *B*.

## EXAMPLE 3.

A person dying left to four of his relations *A*, *B*, *C* and *D*, £140. *A* was to receive £50, *B* £40, *C* £30 and *D* £20, when each one had received his legacy, they agreed to make a Stock of the whole ; *A* put his sum in for 6 months, *B* for 9 months, *C* for 12 months, and *D* for 15 months, by which they gain £200. What must each man receive of the gain in proportion to his Stock and the Time of employing it? When

When many partners are concern'd it will be better to find a pound rate or common multiplier, as before taught in *Single Fellowship*, page 363, viz. by dividing the whole loss or gain by the sum of the products, and the quotient will be a pound rate, by which the product of each man's stock and time being multiplied, will produce his share of the loss or gain.

See the following Operation.

$$\begin{array}{l} 50 \\ 40 \\ 30 \\ 20 \end{array} \times \begin{array}{l} 6 \\ 9 \\ 12 \\ 15 \end{array} = \begin{array}{l} 300 \\ 360 \\ 360 \\ 300 \end{array} \text{ the prod. of } \begin{array}{l} A's \\ B's \\ C's \\ D's \end{array} \text{ Stock and Time.}$$

$\underline{1320} \quad 200.0 \quad (.151515 \text{ Com. Multiplier:})$

$$.151515 \times \begin{array}{l} 300 \\ 360 \end{array} = \begin{array}{l} 45.4545 \\ 54.5454 \end{array} = \begin{array}{l} 45 \quad 9 \quad 1 \quad A's \\ 54 \quad 10 \quad 10 \frac{3}{4} \quad B's \end{array} \text{ share of the gain.}$$

And as the Prod. of  $\begin{Bmatrix} A's \\ B's \end{Bmatrix}$  Stock and Time is equal to  $\begin{Bmatrix} D's \\ C's \end{Bmatrix}$  consequently their Gain must be equal also.

## EXAMPLE 4.

Five merchants *A B C D* and *E* companied and made a Stock of £4000

$$\begin{array}{l} A's \\ B's \\ C's \\ D's \\ \text{and } E's \end{array} \left\{ \begin{array}{l} \text{Money was in} \\ \end{array} \right. \begin{array}{l} 4 \\ 6 \\ 8 \\ 10 \\ 12 \end{array} \left\{ \begin{array}{l} \text{Months} \end{array} \right.$$

whereby they gained £1400, which was divided in such manner that

$$\text{and } \left\{ \begin{array}{l} \frac{1}{2} \\ \frac{2}{3} \\ \frac{3}{4} \\ \frac{4}{5} \end{array} \right\} \text{ of } \begin{array}{l} A's \\ B's \\ C's \\ D's \end{array} \text{ Gain was equal to } \left\{ \begin{array}{l} \frac{1}{3} \\ \frac{1}{4} \\ \frac{1}{5} \\ \frac{1}{6} \end{array} \right\} \text{ of } \begin{array}{l} B's \\ C's \\ D's \\ E's \end{array} \text{ Gain}$$

Quere, what did each merchant gain and put in?  
First,

First, If *A*'s Gain be supposed to be 2, then *B*'s will be 3, *C*'s 4, *D*'s 5, and *E*'s 6, which added together make 20. Then

$$\text{As } \begin{matrix} \text{£} & \text{£} \\ 20 & 1400 \end{matrix} :: \begin{matrix} \text{£} \\ \left\{ \begin{array}{c} 2 \\ 3 \\ 4 \\ 5 \\ 6 \end{array} \right\} \end{matrix} : \begin{matrix} \text{£} \\ \left\{ \begin{array}{c} 140 \text{ } A's \\ 210 \text{ } B's \\ 280 \text{ } C's \\ 350 \text{ } D's \\ 420 \text{ } E's \end{array} \right\} \end{matrix} \text{ Gain.}$$

Now having proceeded so far we have the whole Stock, each man's Gain and Time given, to find each man's particular Stock, which is easily obtained by the following general

## R U L E.

Multiply \* each man's Loss or Gain \* continually  
By each one's Time except his own,  
This done—say by the *Rule of Three*;  
As th' Sum of all these products be  
To the whole Stock—so is you'll find,  
Each of these Products so combin'd  
To each man's Stock—be't less or more,  
That you in numbers must explore.

$$\begin{array}{l} 140 \\ 210 \\ 280 \\ 350 \\ 420 \end{array} \times \begin{array}{c} \left\{ \begin{array}{c} 6 \\ 4 \\ 4 \\ 4 \\ 4 \end{array} \right\} \times \left\{ \begin{array}{c} 8 \\ 8 \\ 6 \\ 6 \\ 6 \end{array} \right\} \times \left\{ \begin{array}{c} 10 \\ 10 \\ 10 \\ 8 \\ 8 \end{array} \right\} \times \left\{ \begin{array}{c} 12 \\ 12 \\ 12 \\ 12 \\ 10 \end{array} \right\} = \begin{array}{c} \left\{ \begin{array}{c} 206400 \\ 806400 \\ 806400 \\ 806400 \\ 806400 \end{array} \right\} \\ \hline 4032000 \\ \hline \end{array}$$

As

Now we have the whole Stock, each man's Gain and Time given to find each man's particular Stock, to do which proceed according to the *Rule* given in *page 372*, and the work will stand as under.

$$\begin{array}{r} 52 \times 5 \times 7 = 1820 \\ 78 \times 3 \times 7 = 1638 \\ 104 \times 3 \times 5 = 1560 \\ \hline \text{Sum } 5018 \end{array} \left. \vphantom{\begin{array}{r} 52 \times 5 \times 7 \\ 78 \times 3 \times 7 \\ 104 \times 3 \times 5 \end{array}} \right\} \text{Products}$$

$$\begin{array}{r} \text{As } 5018 : 3822 :: \left\{ \begin{array}{l} 1820 \\ 1638 \\ 1560 \end{array} \right\} : \left\{ \begin{array}{l} 1386 \quad 4 \quad 4 - \frac{176}{193} \\ 1247 \quad 11 \quad 11 - \frac{194}{193} \\ 1188 \quad 3 \quad 8 \frac{3}{4} - \frac{13}{193} \end{array} \right\} \begin{array}{l} A's \\ B's \\ C's \end{array} \end{array} \left. \vphantom{\begin{array}{l} 1386 \\ 1247 \\ 1188 \end{array}} \right\} \text{Stock.}$$

Proof £3822 — — the whole

Or thus,

$$\begin{array}{r} \text{3) } 52(17 \frac{1}{3}) \\ \text{5) } 78(15 \frac{1}{3}) \\ \text{7) } 104(14 \frac{2}{3}) \end{array} = \left\{ \begin{array}{l} 17 \frac{35}{103} \quad A's \\ 15 \frac{63}{103} \quad B's \\ 14 \frac{90}{103} \quad C's \end{array} \right\} \text{Gain per month.}$$

Sum  $47 \frac{83}{103}$

$$\text{As } £47 \frac{83}{103} : 3822 :: \left\{ \begin{array}{l} 17 \frac{35}{103} \\ 15 \frac{63}{103} \\ 14 \frac{90}{103} \end{array} \right\} : \left\{ \begin{array}{l} A's \\ B's \\ C's \end{array} \right\} \text{Stock, the same as above.}$$

*Note.* Mr. Hill (in his Arithmetic *page 285*) makes each one's Stock to be as under, viz.

$$\begin{array}{r} \text{A's } 468 \\ \text{B's } 1170 \\ \text{C's } 2184 \end{array} \left. \vphantom{\begin{array}{r} 468 \\ 1170 \\ 2184 \end{array}} \right\} \text{instead of } \left\{ \begin{array}{l} 1386 \quad 4 \quad 4 - \frac{176}{193} \\ 1247 \quad 11 \quad 11 - \frac{194}{193} \\ 1188 \quad 3 \quad 8 \frac{3}{4} - \frac{13}{193} \end{array} \right\} \text{the true Stock found as above.}$$

Quest.

Question 2. by Buteo,  
(Publish'd near 200 Years ago.)

A Merchant's real Stock being £120 and the Factor's £60, they agreed that at the year's end the Factor should have  $\frac{x}{2}$  of both Stock and Gain, but they broke up at 8 month's end having gained £150. How much ought the Factor to have?

$\text{First, } \overset{\text{£}}{120} + \overset{\text{£}}{60} = \overset{\text{£}}{180}$  the whole Stock, half of which is £90 each man's share thereof at the year's end, whereby it is plain that had the Stock continued in trade during that time, the Factor must have had £30 of the Merchant's Stock, but as it continued only 8 months or  $\frac{2}{3}$  of a year, therefore  $\frac{2}{3}$  of £30 = £20 is the Factor's share of the Merchant's Stock, which share

$\overset{\text{£}}{20}$  { taken from 120 leaves 100 }  $\overset{\text{£}}{80}$  { Mercht's  
being { added to 60 makes 80 }  $\overset{\text{£}}{80}$  { Factor's  
Stock at the 8 months end or time of breaking up.

$\text{adly. As } \overset{\text{£}}{180} : \overset{\text{£}}{150} :: \overset{\text{£}}{100} : \overset{\text{£}}{83} \overset{\text{s}}{6} \overset{\text{d}}{8} \text{ the Mercht's}$   
 $\overset{\text{£}}{80} : \overset{\text{£}}{66} \overset{\text{s}}{13} \overset{\text{d}}{4} \text{ the Factor's gain.}$   
 $\text{Then, } \overset{\text{£}}{100} + \overset{\text{£}}{83} \overset{\text{s}}{6} \overset{\text{d}}{8} = \overset{\text{£}}{183} \overset{\text{s}}{6} \overset{\text{d}}{8} \text{ the Mercht's}$   
 $\text{and } \overset{\text{£}}{80} + \overset{\text{£}}{66} \overset{\text{s}}{13} \overset{\text{d}}{4} = \overset{\text{£}}{146} \overset{\text{s}}{13} \overset{\text{d}}{4} \text{ the Fact's Share of the whole}$

B A R T E R.

**B**ARTER, discovers you will see,  
The worth of each commodity,  
That is exchang'd, or truck'd in trade,  
The terms be what they will that's made,  
And no one party, loss-sustain,  
As underneath I shall explain.

## R U L E.

First find the value of what's sold,  
 Whose given quantity is told,  
 Then for this worth you must find true,  
 What quantity o'th' other's due,  
 At th' given rate, and then you may  
 An answer find without delay.  
 When goods are rated something more  
 Than ready money price, be sure,  
 Proportion thus—now to go on  
 As th' ready money price of one,  
 Is to its Bart'ring price, I say,  
 So is the money price alway  
 Of th' other to its Bart'ring price,  
 This done, now *Tyro* in a trice;  
 You'll quickly find the quantity,  
 O'th' party's last commodity;  
 From th' ready money, (mind me still)  
 Or Bart'ring price, be what it will.

## EXAMPLE I.

Suppose I have 300 yards of linen Cloth, worth 18d per yard, which I would truck for Cheese at 32s per C. of 120 lb to the C. How much Cheese must I receive for my linen Cloth?

$$\begin{array}{rcl}
 \begin{array}{r}
 d \quad \quad \quad \pounds \\
 6 \frac{1}{2} | 30.0 \\
 \text{Deduct } 7.5 \\
 \hline
 \pounds \left\{ \begin{array}{l} 2 ) 22.5 \\ \hline .8 ) 11.25 \end{array} \right. & \left. \begin{array}{l} \text{the Price of the} \\ \text{Linen at} \end{array} \right\} & \left\{ \begin{array}{l} 2 - \\ - 6 \\ \hline 16 \\ \hline - 9 \end{array} \right\} \text{ per yard} \\
 32 = 1.6 & & \\
 \text{Answer, } C14.0625 = C14 - 7 \frac{1}{2} \text{ qr } 16
 \end{array}$$

EXAM-

EXAMPLE 2.

*A*, and *B* Barter, *A* hath 200  $\frac{1}{2}$  yards of Kersey at 9s 6d per yard; *B* hath 80 yards of Velvet at 1 guinea per yard. *Quere*, which must pay balance, and how much?

£ s d			£ s d		
10s	$\frac{1}{2}$	200 10 -	the value of the	Kersey at	- - -
6d	$\frac{1}{16}$	100 5 -		- 10 -	
Deduct 5		- 3		- - 6	
From 95		4 9		- 9 6	
Take 84		- -		Velvet at £ 1 1s	
Rems. £ 11		4 9	Kersey more than the Velvet which must be paid by B to A.	per Yard	

EXAMPLE 3.

A Farmer sold to a Maltster 364 bushels of Barley at 3s 8d per bushel, for which he received by agreement 50 bushels of Malt and £54 6s 9d in Cash. What was the Malt valued at per bushel?

£ s d			£ s d		
4s	$\frac{1}{2}$	364 - -	the value of	the Barley at	
4d	$\frac{1}{12}$	72 16 -		- 4 -	
Deduct 6		1 4		- - 4	
From 66		14 8		- 3 8	
Deduct 54		6 9		Cash receiv'd	
50 { 5 ) 12		7 11	the	Malt	
10 ) 2		9 7		10 Bushels	
Answer 54		11 $\frac{1}{2}$		1 Bushel	

## EXAMPLE 4.

*C*, hath Corn at five shillings *per* bushel, not more,  
But in Barter will have just one third of a score.  
*D*, a *Manchester* Tradesman, hath Fustians we find,  
Worth in ready money the sum here subjoin'd. \*  
Then how much *per* yard must the Fustian by *D*,  
Be rated equivalent with *C*'s to agree ?

As 5*s* the ready Money price of the Corn, is to 6*s* 8*d*  
the bartering price, so is 2*s* 9  $\frac{1}{2}$ *d* the ready money price  
of the Fustian, to 3*s* 8  $\frac{1}{2}$ *d*  $\frac{3}{4}$ , the bartering price thereof.

## PROMISCUOUS QUESTIONS.

Question 1. by Mr. John Saxton.

(See his Arithmetic page 289.)

*A* and *B* Barter, *A* has 1375 yards of Shalloon at  
19*d* *per* yard, for which *B* gives him broad Cloth at  
17*s* 4*d* *per* yard, and a Bill of £50 due 6 months  
hence. How many yards must *A* give *B* besides the Bill?

£ s d			the value of the	£ s d			per yard
1 <i>s</i> $\frac{1}{8}$	1375	—		Shalloon at	1	—	
6 <i>d</i> $\frac{1}{2}$	68	15			—	1	
1 <i>d</i> $\frac{1}{8}$	34	7			—	6	
	5	14			—	1	
			—		1	7	
From 108 17 1			£50 Bill discounted.				
Dedt. † 48 15 7 $\frac{1}{4}$				Broad Cloth at 17 <i>s</i> 4 <i>d</i> <i>p.</i> yd.			
Rems. £60 1 5 $\frac{3}{4}$							

As 17*s* 4*d* : 1 yd. :: £60 1*s* 5*d*  $\frac{3}{4}$  : 69 yds. 5 nls. Anfr.

\* 2*s* 9  $\frac{1}{2}$ *d* *per* yard.

† The present worth of the Bill is easily known by  
proceeding according to *Cor.* 2 in Simple Interest  
*page* 331, or by the Rule in *page* 351, thus, As £102 10*s*  
(the amount of £100 for 6 months at lawful Interest)  
is to (its principal, or present worth) £100 so is £50  
(the value of the Note) to £48 15*s* 7*d*  $\frac{1}{4}$  the present  
worth, as above. Ques.

## Question 2. by Mr. Hatton.

Two Merchants have various kinds of goods to Barter. *A* hath 735 yards of *Indian Silk* at 8s 6d per yard ready money, and in Barter 10s, also 532 Canes at 3s a piece ready money, and in Barter 3s 4d, and 16 pieces of *Muslin* at £4 a piece ready money, and in Barter £4 10s. *B* hath scarlet Cloth at £1 per yard ready money; Glass Manufacture at 1s 8d per pound ready money, and a finer kind at 2s 4d per pound. How many yards of Cloth and pounds of each kind of Glass of all alike number must *B* give *A* advancing his goods proportionally also in Barter?

	<i>s</i>	<i>d</i>		<i>£</i>	<i>s</i>	<i>d</i>
<i>A</i> 's {						
Silk, 735 yds. at 8 6 per yd.			com. 9	312	7	6
Canes, 532 at 3s a piece				79	16	—
Muslin, 16 pieces at £4 a piece				64	—	—
				Sum £456 3 6		

	<i>£</i>	<i>s</i>	<i>d</i>
The price of 1 {			
yd of B's {			
lb of B's {			
lb of B's {			
Scarlet Cloth.	1	—	—
Glass Manufac.	—	1	8
finer sort.	—	—	2 4
	Sum £1 4 —		

Now divide 109482 the pence in £456 3s 6d by 288 the pence in £1 4s, and the quotient will be  $380\frac{42}{8} = 380\frac{7}{8}$  the Answer.

## L O S S and G A I N.

**B**Y *Loss and Gain*, you're learned fair,  
 To act with Justice and prepare  
 The price of each commodity,  
 In such proportion to agree  
 That no one injured shall be,

When

Whene'er the Loss or Gain is given,  
 O'th' quantity be't odd or even,  
 To find th' value of any part  
 Thereof, pray get this Rule by heart.

## R U L E.

First say as the whole quantity  
 Of goods, or ware, whate'er they be,  
 Is to the sum of Cost and Gain,  
 So's any part I will maintain,  
 Of the said goods be what they will,  
 To th' price they're sold for,—mind me still,  
 And when the Gain or Loss is found  
 So much *per Cent.*—one hundred pound  
 Add to the Gain, if Loss subtract,  
 To make your second term exact.

## EXAMPLE 1.

Admit a Cheesemonger buys 8 Ton, 12 C. 3 qrs.  
 8 lb of Cheese, at £1 14s 6d per C. and sells it out  
 again at £2 3s 9d per C. What does he Gain upon  
 the whole? £ s d

First from 2 3 9 } the { Selling Price  
 Take 1 14 6 } { Prime Cost  
 C. ————— } { Gain of a C. fo is 8 12 3 8  
 Then, As 100 — 9 3 }  
 to £79 18s 7d the Answer.

## EXAMPLE 2.

If two pence three farthings per Shilling I gain,  
 My profit *per Cent.* Try to me explain?

d      £ s d      d  
 3 | ¼ | 100 — — } the Gain  
 2 | 12 | 25 — — } per Cent.  
 Deduct 2, 1. 8 }  
 Rems. £22. 18. 4 }  
 s d      £      £ s d

Or, As 1:2¼ :: 100 : 22 18 4 the Answer as above.

EXAM-

EXAMPLE 3.

If Cloth for twelve Shillings *per* yard I can buy,  
Then how must I sell it be pleas'd to descry,  
To gain thirty *per Cent.* for the use of my cash,  
Should I happen to sell it to *Timothy Flash*?

$  \begin{array}{r}  \text{£} \quad \text{s} \quad \text{d} \\  20 \left  \frac{1}{5} \right  12 \quad - \\  \hline  10 \left  \frac{1}{2} \right  \quad \quad \quad \\  \hline  \text{Ans. } 15 \quad 7 \quad \frac{4}{5}  \end{array}  $	} the	$  \left\{ \begin{array}{l} \text{Prime Cost of a Yard} \\ \text{Gain} \\ \text{Price} \end{array} \right\} \text{ of a Yard at } \left\{ \begin{array}{l} \text{£.} \\ 20 \\ 10 \\ 30 \end{array} \right\} \text{ per Cent. Profit.}  $
--	-------	--

Or, As  $100 : 130 :: 12 : 15 \quad 7 \quad \frac{4}{5}$  the Answer as above.

EXAMPLE 4.

By damaged Stockings suppose I should lose,  
Nine farthings *per* Shilling by selling my Hose,  
Then how much *per Cent.* should I lose by my Ware,  
Ingenious young *Tyre*,—be pleas'd to declare.

$  \begin{array}{r}  \text{d} \quad \text{£} \quad \text{s} \quad \text{d} \\  2 \left  \frac{9}{16} \right  100 \quad - \quad - \\  \hline  \frac{1}{4} \left  \frac{1}{8} \right  16 \quad 13 \quad 4 \\  \quad \quad \quad 2 \quad 1 \quad 8 \\  \hline  \text{Ans. } 18 \quad 15 \quad -  \end{array}  $	} the Loss	$  \left\{ \begin{array}{l} \text{per Cent. at} \\ 12 \\ 2 \\ \frac{1}{4} \\ 2 \frac{1}{4} \end{array} \right\} \text{ per Shilling.}  $
--	------------	--

Or, As  $1 : 2 \frac{1}{4} :: 100 : 18 \quad 15$  the Answer as above.

EXAMPLE 5.

Suppose a *Manchester* Tradesman buys Yarn, to  
the value of £240, and sells the same out again imme-  
diately for £254 10s 6d with 6 months Credit. What  
does he gain *per Cent*? *First.*

First, From £ 248 6s 4d the present worth of £ 254 10s 6d, (being what the Yarn was sold for at 6 months Credit) deduct £ 240 (the prime Cost) and there will remain £ 8 6s 4d, the Gain upon the whole.

£   £ s d   £   £ s d

Then, As 240 : 8 6 4 :: 100 : 3 9 3  $\frac{1}{2}$  the Answer.

Or, As £ 240 (the prime Cost of the Yarn) is to £ 14 10s 6d (the whole Gain had there been no Credit,) so is £ 100 to £ 6 1s -d  $\frac{1}{2}$  the Gain *per Cent.* had the Yarn been sold for ready Money, but 6 months Credit being given, therefore deduct the Rebate of £ 106 1s -d  $\frac{1}{2}$  for 6 months, (which will be easily found by the *Rule* in page 351) from £ 6 1s -d  $\frac{1}{2}$  and there will remain £ 3 9s 3d  $\frac{1}{2}$  the Answer the same as before.

### Remark.

Some Authors take Questions of this kind in a different sense, and would solve the preceding Question thus, £   Gain   £   Gain

As 240 : 14.525 :: 100 : 6 052. and then say

Mon. Gain   Mon. Gain   £ s d

As 6 : 6.052 :: 12 : 12.104 = 12 2 1. which they would call the Answer : In this manner Mr. Birks solves Question 23, in his Arithmetic, page 378, but this method (according to the conditions of the Question) is very erroneous.

### EXAMPLE 6.

A Sportsman coursing near the Banks of Dee, }  
Up bounces Pusn—just sixty Yards † was she }  
Before the Dog,—but Smoker dont her see }

\* Note. The present worth of £ 254 10s 6d for 6 months at lawful Interest is easily found by Cor. 2 in Simple Interest, page 331, or by the *Rule* in page 351 to be £ 248 6s 4d as above.

† i. e. Sixty Yards before the Greyhound at her first getting up.

'Till fifty seconds were elaps'd, not more,  
 Then John espies her, and cries out *To-ore*,  
 Now *Smoker* skims along the chequer'd Plains,  
 The woods resound to th' emulous *Sportsman's* strains.  
 Poor *Puss* is taken, and the Chase is done,  
 The Time ascertain, and what Ground was run;  
 When *Smoker* leap'd at twenty miles per hour,  
 And *Puss* just at the rate of four times four.

*Hour Miles Secds Yards*

First, As 1 : 16 :: 50 :  $39\frac{1}{2}$  which add to 60 and the Sum will be  $45\frac{1}{2}$  yards the Distance the Hare had at start. Now as (by the Question) the Dog's rate was 4 miles an hour more than the Hare's, therefore

	<i>Miles Hour Yards Min Secds</i>	$\left. \begin{array}{l} \text{Time.} \\ \text{Dist.} \end{array} \right\} \text{ran by the Dog.}$
As 4 :	1 :: $45\frac{1}{2}$ : $3\ 50\frac{1}{2}$	
	<i>Hour Miles Min Secds Yards</i>	
Then As 1 :	20 :: 3 : $50\frac{1}{2}$ : $2255\frac{5}{9}$	

But the Distance ran by the Dog may be easily found without knowing the Time he ran, for it is plain by the Question, that in running 20 miles he would gain 4 viz.  $\frac{1}{2}$ , consequently  $45\frac{1}{2}$  yards (the Distance the Hare had at start) must be  $\frac{1}{3}$  of the

	<i>Yards</i>	$\left. \begin{array}{l} \text{Dist.} \\ \text{Time} \end{array} \right\} \text{as above.}$
Chase, and 5 times $45\frac{1}{2}$ =	$2255\frac{5}{9}$	
	<i>Miles Hour Yards Min Secs</i>	
And then As 20 :	1 :: $2255\frac{5}{9}$ : $3\ 50\frac{1}{2}$	

*Note.* The above Question I propos'd many years ago, and inserted it in a Miscellany of Poems and Mathematical Articles which I published in the year 1768; and as both Loss and Gain are concerned in the Question, I thought it might very properly come under the denomination of this Rule.

## PROMISCUOUS QUESTIONS.

## Question 1. by Mr. Webster.

See the second Edit. of his Arithmetic, page 32.

If by selling Cloth at 5s per Ell I gain £8 per Cent. What shall I gain per Cent. if I sell the Ell at 6s 3d?

£  
First to 100  
Add 8

s   —   s d   £

Then As 5 : 108 :: 6 3 : 135, from which deduct £100 and there will remain £35 the Answer, which in Mr. Webster's Arithmetic is only £10.

*Note.* This and the four following Questions Mr. Vyse has taken into his Arithmetic, because their Authors have solved them wrong, the Error consists in the stating of the Questions, by making the Gain or Loss of £100 the second term instead of its Amount.—Mr. Hutton likewise remarks upon these Questions, but as neither of these ingenious Gentlemen have shewn the young Tyro how to proceed properly to solve them, I therefore thought it necessary to give them a place in this Treatise.

## Question 2. by Mr. Stonehouse.

See the second Edit. of his Arithmetic, page 103.

At 5s per Dozen I gain £7 10s per Cent. how much shall I gain per Cent. if I sell the Dozen at 5s 9d?

s   £   s   s d   £   s d

As 5 : 107 10 :: 5 9 : 123 12 6. from which deduct £100 and there will remain £23 12s 6d the Answer, which in Mr. Stonehouse's Arithmetic is only £8 12s 6d.

Quef.

Question 3. by Mr. Hill.

See the 10th Edition of his Arithmetic, page 289.

A Manchester Chapman going to a Fair, sold Fustians for 11s 6d the End, wherein was gained £15 per Cent. and seeing no other Chapman had so good, raiseth them at the latter end of the Fair to 12s. I demand what he gained per Cent. by this last Sale?

$$\begin{array}{ccccccc} s & d & £ & s & £ & & £ \\ \text{As } 11 & 6 & : & 115 & :: & 12 & : & 120, \text{ from which deduct } 100 \\ \text{and the remainder will be } £20 \text{ the Answer, which in} \\ \text{Mr. Hill's Arith. is only } £15.652 \text{ \&c.} = £15 \text{ } 13s - d\frac{1}{2}. \end{array}$$

Question 4. by Mr. Dilworth.

See the second Edit. of his Arithmetic, page 73.

Suppose I sell 500 Deals at 15d per piece and £9 per Cent. loss. What do I lose by the whole Quantity?

$$\begin{array}{r} £ \\ \text{First from } 100 \\ \text{Take } 9 \\ \hline \end{array}$$

$$\begin{array}{ccccccc} & & £ & & £ & s & \\ \text{Then As } 91 & : & 100 & : & 31 & 5 & \text{ (the price of the Deals} \\ \text{at } 15d \text{ a piece): } £34 & 6s & 9d\frac{3}{4}, \text{ from which deduct} \\ £31 & 5s, \text{ and there will remain } £3 & 1s & 9d\frac{3}{4} \text{ the Answer,} \\ \text{which in Mr. Dilworth's Arithmetic is only } £2 & 16s & 3d. \end{array}$$

Question 5. by Mr. Walkingham.

See the third Edition of his Arithmetic, page 70.

Suppose I sell 1 Cwt. of Hops for £6 15s and gain £25 per Cent. What would have been the gain per Cent. if I had sold them for £8 per Cwt?

$$\begin{array}{ccccccc} £ & s & £ & £ & £ & s & d \\ \text{As } 6 & 15 & : & 125 & :: & 8 & : & 148 \text{ } 2 \text{ } 11\frac{1}{2}, \text{ from which deduct} \\ £100 \text{ and there will remain } £48 & 2s & 11d\frac{1}{2} \text{ the Answer,} \\ \text{which in Mr. Walkingham's Arith. is only } £29 & 12s & 7d. \end{array}$$

## E X C H A N G E.

**E**XCHANGE consists in finding fair,  
 What quantities of Monies are  
 In diff'rent places equal, and  
 The same—as you will understand.  
 To work *Exchange* conspicuously,  
 Use *Practice*, or, the *Rule of Three*.

The *Course* of *Exchange* between any two kingdoms, rises and falls upon different occasions; *i. e.* is sometimes above and sometimes below the *Par*.

The *Par* of *Exchange* is always fixed, it being the intrinsic value of any *foreign* money compared with *Sterling*.

Money in the Bank of other kingdoms, is finer, or purer than that which is current, the difference of value in each is called *Agio*.

As there would be no end in treating of every kind of *Exchange*, in all *Countries*, I shall only treat of the *Exchange* of *England*, with a few of the chiefest *Countries* in *Europe*, &c.

First. With *IRELAND*, *AMERICA*, and the *WEST-INDIES*.

In these *Countries* their accounts are kept in Pounds Shillings and Pence the same as in *England*.—The *Par* of *Exchange* between *England* and *Ireland* is £100 *Sterling* for £108 6s 8d *Irish*, viz. 1s *English* for 13d *Irish*.—The *Course* of *Exchange* is from 5 to 12 *per Cent.* according to the balance in trade.

In *America* their Money is called *Currency*. In the *West-Indies* £5 *Sterling* is worth 7 of the *Currency*, owing to the great plenty of foreign coins circulating there; but on the *Continent* of *America*, cash is so scarce that they are obliged to substitute *Paper Currency* to carry on trade, which being subject to casualties, suffer a great discount in the purchasing of *Bills of Exchange*.

EXAM-

EXAMPLE 1.

London remits to Dublin £1460 10s Sterling. What must be receiv'd there, Exchange at £110  $\frac{1}{2}$  per Cent?

£	£	s	d		£	
10   $\frac{1}{10}$	1460	10	—	} the value at	100	} per Cent.
$\frac{1}{2}   \frac{1}{20}$	146	1	—		10	
	7	6	— $\frac{1}{2} \frac{2}{5}$		$\frac{1}{2}$	
Answer	1613	17	— $\frac{1}{2} \frac{2}{5}$		110 $\frac{1}{2}$	

Or, As 100 : 110  $\frac{1}{2}$  : 1460 10 = 1613 17 —  $\frac{1}{2} \frac{2}{5}$  the Answer as above.

EXAMPLE 2.

Dublin remits to London £1613 17s —  $\frac{1}{2} \frac{2}{5}$ . What must be receiv'd there, Exchange at £110  $\frac{1}{2}$  per Cent?

£	s	£	£	s	d	£	s
As 110	10	: 100	::	1613	17 — $\frac{1}{2} \frac{2}{5}$	: 1460	10 the Anf.

EXAMPLE 3.

Admit any part of the *West-Indies* is indebted to London in £4168 16 10  $\frac{1}{2}$  Currency. What Sterling, must be receiv'd for the same, the Exchange being £150 per Cent?

£	£	£	s	d	£	s	d
As 150	: 100	::	4168	16 10 $\frac{1}{2}$	: 2779	4 7	the Answer.

But *Note*, the work of the *Rule of Three* may often be much abbreviated by placing the first and second terms, or the first and third terms of the stating, as a vulgar fraction, making the first term the denominator of such fraction, and reducing it to its lowest terms,

for the value of that fractional part of the other term will be the answer, thus: the first and second terms in the preceding stating placed as a fraction become  $\frac{198}{138} = \frac{2}{3}$  in its lowest terms, then  $\frac{2}{3}$  of the other term £4168 16s 10d  $\frac{1}{2}$  will (by *Case 12* in *Vulgar Fractions*, page 255, or by *Article 2*, page 274,) be easily found to be £2779 4s 7d, the same as in the preceding page.

## EXAMPLE 4.

Suppose *London* receives a bill of Exchange from any part of the *West Indies* for £2779 4s 7d *Sterling*. For how much *Currency* was *London* indebted, Exchange being at 50 per Cent?

£	£	s	d		£	
50 $\frac{1}{2}$	2779	4	7	}	the value at	}
	1389	12	$3\frac{1}{2}$		100	
	1389	12	$3\frac{1}{2}$		50	
Ans. £	4168	16	$10\frac{1}{2}$		150	per Cent.

**Second, With HOLLAND, FLANDERS, and GERMANY.**

In these Countries their accounts are kept in Pounds, Shillings and Pence, as in *England*, and sometimes in Guilders, Stivers and Pennings.—In *Holland* and *Flanders* the Money is distinguished by the name of *Flemish*; Exchange being made with *London* from 30s to 38s *Flemish* per Pound *Sterling*.

## NOTE.

8 Pennings	}	make one	Groat	20 Stivers	}	make one	Flor. or Guild.
2 Groats			Stiver	$2\frac{1}{2}$ Florins			Rix Dollar
6 Stivers			Shilling	6 Florins			Pound <i>Flemish</i>
			5 Guilders				Ducat

EXAM-

EXAMPLE 1.

How much *Flemish* will £840 *Sterling*, amount to Exchange being at *Par*, viz. 33s 4d *Flemish* per Pound *Sterling*?

As  $\begin{matrix} \text{£} & \text{£} & \text{s} & \text{d} & \text{£} & \text{£} \\ 1 & : & 1 & 13 & 4 & :: 840 : 1400 \end{matrix}$  the Answer.

Or, by the *Alors* in page 387.—The pence in a pound *Sterling*, and 33s 4d placed as a fraction and reduced to its lowest terms become  $\frac{2}{3} = 1\frac{2}{3}$  therefore to £840 add the  $\frac{2}{3}$  of itself and the sum will be £1400 the same as above.

EXAMPLE 2.

How much *Sterling* will £1400 *Flemish* amount to, Exchange at 33s 4d per pound *Sterling*?

As  $\begin{matrix} \text{£} & \text{s} & \text{d} & \text{£} & \text{£} & \text{£} \\ 1 & 13 & 4 & : & 1 & :: 1400 : 840 \end{matrix}$  the Answer.  
Or  $\frac{2}{3} \times 1400 = 933\frac{1}{3}$ , and  $\frac{2}{3}$  of £1400 = £840 as above.

C O R O L L A R Y.

When *Flemish* Pounds Shillings and Pence are to be reduced to *Guilders*.—Divide the whole Sum when reduced into Pence *Flemish* by 40 (the number of Pence in one *Guilder*) and the quota will be *Guilders*, the remainder (if any) will be Pence, which divide by 2 (the Pence in one *Stiver*) and the quotient will be *Stivers*.

EXAMPLE 3.

In £846 16s *Flemish*, how many *Guilders*?

$$\begin{array}{r} \text{£} \quad \text{s} \\ 846 \quad 16 \\ \underline{20} \\ 17296 \\ \underline{12} \\ 410 \overline{) 207552} \end{array}$$

Answer 5188  $\frac{1}{2}$  *Guilders* = 5188 16

*Gul. Stiv.*

## EXAMPLE 4.

In 5188 *Guil.* 16 *St.* How many *Flemish Pounds*?

$$\begin{array}{r} \text{Guil. St.} \\ 5188 \ 16 = 32d. \\ \underline{40} \end{array}$$

$$\begin{array}{r} 12)207552 \\ \hline 2|0)1729|6 \end{array}$$

£864 16s Ans.

to its value in *Banco*. And as 100 is to 100 with the *Agio* added to it, so is the *Banco* given to its value *Current*.

## COROLLARY 2:

When you are to change *Current* money into *Banco*, and *Banco* into *Current*, they must be proportioned thus, As 100 with the *Agio* added to it, is to 100 *Banco*,

so is any given sum *Current* to its value in *Banco*. And as 100 is to 100 with the *Agio* added to it, so is the *Banco* given to its value *Current*.

☞ *Bank* money being worth more than *Current*, the difference is called *Agio*, and is from 3 to 6 *per Cent.* in the *Bank's* favour.

## EXAMPLE 5.

Change 110 *Guilders* 12 *Stivers Current*, into *Banco Florins*, *Agio* 4 *per Cent.*

*Guil. Guil. Guil. St. Guilt. St. Gr. Pen.*

As 104:100::110 12:106 6 1 6 the Ans.

## EXAMPLE 6.

Change 340 *Guilders* 12 *Stivers Banco* into *Current*, *Agio* 4  $\frac{5}{8}$  *per Cent.*

*Guil. Guil. St. Gr. Guilt. St. Guil. St.*

As 100:104 12 1::340 12:356 7 Answer.

Third, With F R A N C E. ●

At *France* accounts are kept in *Livres Sols* and *Deniers*, Exchange being made by the *French Crown*, whose *Par* is 4s 6d *Sterling*.

*Note.* Twelve *Deniers* make 1 *Sol*, or *Sou*; 20 *Sols* 1 *Livre*, and 3 *Livres* 1 *Crown*, or *Ecu*.

EXAM-

EXAMPLE 1.

What *Sterling* money must a Merchant pay in *London* to receive in *Paris* 4000 Crowns, Exchange at 54*d*. per Crown, or Ecu?

C d      C      £

As 1 : 54 :: 4000 : 900 the Answer.

EXAMPLE 2.

What number of Crowns must be paid at *Paris* to receive in *London* £900, Exchange 54*d*. per Crown?

d C      £      C

As 54 : 1 :: 900 : 4000 the Answer.

EXAMPLE 3.

What will 140 Livres, 6 Sols, 8 Deniers amount to in *London*, at 56*d*. per Crown or Ecu at *Paris*?

Cr. d      Liv. sol den.      £      s      d

As 1 : 56 :: 140    6    8 : 10 18 3  $\frac{1}{9}$  the Answer.

EXAMPLE 4.

To how much *French* money will £10 18*s* 3*d*  $\frac{1}{2}$  *Sterling* amount, Exchange at 56*d*. per Crown?

d C      £      s      d      Liv. sol den

As 56 : 1 :: 10 18 3  $\frac{1}{2}$  : 140    6    8 nearly Answer.

Fourth, With S P A I N.

In this Kingdom they keep their accounts in Piaſtres, Reals and Marvadies, and Exchange by the Piaſtre, whose *Par* is 4*s* 6*d* *Sterling*.

*Note.* 372 Marvadies make 1 Rial, and 8 Rials 1 Piaſtre.

EXAM-

## EXAMPLE 1.

For six hundred Guineas of good *British* gold,  
How many Piaſtres I pray let be told,  
Exchange fifty pence, *per* Piaſtre, not more,  
All this with much eaſe you may quickly explore?  
*d* *Pi.* *Guin.* *Pi.*

As 50 : 1 :: 600 : 3024 the Answer.

## EXAMPLE 2.

Suppoſe *Spain* draws upon *London* for 3024 Piaſtres: What *Sterling* money will this draught amount to, when the Exchange is 50*d* *per* Piaſtre?

*Pi.* *d* *Pi.* *£*

As 1 : 50 :: 3024 : 630 the Answer.

## EXAMPLE 3.

Change £4000 10*s* 4*d*  $\frac{1}{4}$  *Sterling* into *Spaniſh* money, Exchange at 54*d*  $\frac{1}{2}$  *per* Piece of Eight?

*d* *P.* *£* *s* *d* *Pieces*

As 54  $\frac{1}{2}$  : 1 :: 4000 10 4  $\frac{3}{4}$  : 17698  $\frac{33}{44}$ , Answer.

## EXAMPLE 4.

Admit *Bilboa*, or any part of *Spain* remits to *London* 160 Piaſtres, 3 Rials, 8 Marvadies, Exchange at 51*d*  $\frac{1}{2}$  *per* Piaſtre: What will this remittance amount to in *Sterling* money?

*P.* *d* *P. ri. mar.* *£* *s* *d*

As 1 : 51  $\frac{1}{2}$  :: 160 3 8 : 34 8 3  $\frac{2}{4}$   $\frac{29}{71}$  the Answer.

## Fifth, With P O R T U G A L.

Accounts are kept in *Portugal* in Milreas and Reas, and they Exchange by the Milrea, whoſe *Par.* is about 6*s* 8*d*  $\frac{1}{2}$  or 6*s* 9*d* *Sterling*.

*Note.* 400 Reas make 1 Cruſadec, and 1000 Reas, 1 Milrea.

EXAM-

EXAMPLE 1.

A-Merchant at *Lisbon* remits to his Correspondent in *London* 1000 Milreas. How much *Sterling* must he receive, Exchange at 5s 6d per Milrea?

$\begin{array}{r l} s & \\ 5 & \frac{1}{4} \\ d & \\ 6 & \frac{3}{16} \end{array} \left  \begin{array}{l} \text{£} \\ 1000 \\ \hline 250 \\ 25 \\ \hline \end{array} \right.$	$\left. \begin{array}{l} \\ \\ \\ \end{array} \right\} \begin{array}{l} \text{the value in} \\ \text{Sterling money at} \end{array}$	$\left[ \begin{array}{rcl} \text{£} & s & d \\ 1 & - & - \\ \hline - & 5 & - \\ - & - & 6 \\ \hline - & 5 & 6 \end{array} \right] \begin{array}{l} \\ \\ \\ \end{array} \left. \begin{array}{l} \\ \\ \\ \end{array} \right\} \begin{array}{l} \text{per Milrea.} \end{array}$
<p>Answer £275</p>		

EXAMPLE 2.

To how much *Sterling* will 190 Milreas 604 Reas amount, Exchange at 70d  $\frac{1}{4}$  per Milrea?

*Mil. d*      *Mil. Reas*      £    s    d  
 As 1 : 70  $\frac{1}{4}$  :: 190 604 : 55 15 9  $\frac{3}{4}$   $\frac{181}{320}$  the Ans.

EXAMPLE 3.

How many Milreas will £55 15s 9d  $\frac{3}{4}$   $\frac{181}{320}$  amount to, Exchange at 70d  $\frac{1}{4}$  per Milrea?

*d*    *M.*    £    s    d      *Mil. Reas*  
 As 70  $\frac{1}{4}$  : 1 : 55 15 9  $\frac{3}{4}$   $\frac{181}{320}$  : 190 604 the Answer.

SCHOLIUM.

When several weights or measures of different countries are compared together, and it is required to find how many of the one are equal to a given quantity of the other.—First place the numbers alternately under each other in two straight columns, in such manner that no two terms of one kind may be found in one and the same column, then multiply the numbers together in the least column for a divisor, and the numbers in the other column (where the odd term is) for a dividend, and the quotient will be the answer.—The work may often be abridged by rejecting numbers that are alike in both columns.

EXAM-

## EXAMPLE 1.

If 1 Cwt. of goods at *London*, are equal to 124  $\text{lb}$  at *Paris*, and 112  $\text{lb}$  at *Paris* are equal to 100  $\text{lb}$  at *Lisbon*. How many pounds at *London* are equal to 140  $\text{lb}$  at *Lisbon*?

$$\begin{array}{rcccl} & \text{lb} & & \text{lb} & \\ \text{First } 112 & \left. \vphantom{\begin{array}{l} 112 \\ 112 \\ 140 \end{array}} \right\} & \text{at } \left\{ \begin{array}{l} \text{London} \\ \text{Paris} \\ \text{Lisbon} \end{array} \right. & \begin{array}{r} 124 \\ 100 \end{array} & \left. \vphantom{\begin{array}{l} 124 \\ 100 \end{array}} \right\} \text{ at } \left\{ \begin{array}{l} \text{Paris} \\ \text{Lisbon} \end{array} \right. \\ & 112 & & & \\ & 140 & & & \end{array}$$

Then per Scholium.  $112 \times 112 \times 140 = 1756160$  the Dividend, and  $124 \times 100 = 12400$  the Divisor, by which divide 1756160 and the quotient will be 141  $\text{lb}$   $\frac{27}{33}$  the Answer.

## EXAMPLE 2.

If 100  $\text{lb}$  at *Copenhagen* be equal to 80  $\text{lb}$  at *Rome*, and 100  $\text{lb}$  at *Rome* be equal to 114  $\text{lb}$  at *Madrid*.—How many pounds at *Madrid* are equal to 180  $\text{lb}$  at *Copenhagen*?

$$\begin{array}{rcccl} & \text{lb} & & \text{lb} & \\ \text{First } 100 & \left. \vphantom{\begin{array}{l} 100 \\ 100 \end{array}} \right\} & \text{at } \left\{ \begin{array}{l} \text{Copenhagen} \\ \text{Rome} \end{array} \right. & \begin{array}{r} 80 \\ 114 \\ 180 \end{array} & \left. \vphantom{\begin{array}{l} 80 \\ 114 \\ 180 \end{array}} \right\} \text{ at } \left\{ \begin{array}{l} \text{Rome} \\ \text{Madrid} \\ \text{Copenhagen} \end{array} \right. \\ & 100 & & & \end{array}$$

Then per Scholium in the preceding page.  $80 \times 114 \times 180 = 1641600$  the Dividend, and  $100 \times 100 = 10000$  the Divisor, by which divide 1641600 and the quotient will be 164  $\text{lb}$ .  $\frac{4}{5}$  the Answer.

## PROMISCUOUS QUESTIONS.

Question 1. by Mr. John Ward.

See his Mathematicians Guide, page 108. 5th Edit.

Suppose I would Exchange £527 17s 6d for Dollars at 4s 6d a piece, Ducats at 5s 8d a piece, and Crowns at

at 6s 1d a piece, and would have 2 Dollars for 1 Ducat, and 3 Dollars for 2 Crowns. How many of each sort must I have?

First  $54d = 1$  Dollar,  $68d = 1$  Ducat,  $73d = 1$  Crown and  $126690d = £527\ 17s\ 6d$ . Then, as (*per* Question) there must be

and  $\frac{2}{3}$  } Dollars for  $\left\{ \begin{array}{l} 1 \text{ Ducat} \\ 2 \text{ Crowns} \end{array} \right.$

consequently it will be but

and  $\frac{1}{2} \frac{2}{3}$  } of a  $\left\{ \begin{array}{l} \text{Ducat} \\ \text{Crown} \end{array} \right.$  for 1 Dollar

therefore  $54 + \frac{68}{2} + \frac{2 \times 73}{3} = 136\frac{2}{3}$  the Divisor, by

which divide  $126690d$  (see *Division of Vulgar Fractions*)

and the quotient will be  $927\frac{1}{2}$  } the  $\frac{1}{2}$  }  $\left\{ \begin{array}{l} \text{Dollars} \\ \text{Ducats} \\ \text{Crowns} \end{array} \right.$  requir'd.  
and  $\frac{1}{2} \frac{2}{3}$  } of which is  $\left\{ \begin{array}{l} 463\frac{1}{2} \\ 618 \end{array} \right.$  the  $\frac{1}{2}$  }  $\left\{ \begin{array}{l} \text{Dollars} \\ \text{Ducats} \\ \text{Crowns} \end{array} \right.$

Question 2 by Mr. Malcolm.

If I receive 11 Crowns and 7 Dollars for £4 10s 10d, or 4 Crowns and 3 Dollars for £1 15s the value of 1 Crown and 1 Dollar being the same in both. What is that Value?

$$\begin{array}{r} \text{First } 4\ 10\ 10 \\ \text{and } 1\ 15\ 0 \end{array} \left. \vphantom{\begin{array}{r} 4\ 10\ 10 \\ 1\ 15\ 0 \end{array}} \right\} = \left\{ \begin{array}{l} 1090 \\ 420 \end{array} \right.$$

$$\begin{array}{r} d \quad Cr. \quad Do. \\ \text{Then } 1090 = 11 + 7 \left| \begin{array}{l} \text{mult} \\ \text{by } 3 \end{array} \right. \left| \begin{array}{l} 3 \\ 10 \\ 0 \end{array} \right. \left| \begin{array}{l} \text{duce} \\ \text{duce} \\ \text{duce} \end{array} \right. \left| \begin{array}{l} 3270 \\ 2940 \end{array} \right. = 33 + 21 \\ \text{and } 420 = 4 + 3 \left| \begin{array}{l} \text{mult} \\ \text{by } 7 \end{array} \right. \left| \begin{array}{l} 3 \\ 10 \\ 0 \end{array} \right. \left| \begin{array}{l} \text{duce} \\ \text{duce} \\ \text{duce} \end{array} \right. \left| \begin{array}{l} 3270 \\ 2940 \end{array} \right. = 28 + 21 \end{array}$$

$$\text{Rems. } d330 = 5 \text{ Cr.}$$

and consequently the  $\frac{1}{3}$  of  $330d = 5s\ 6d$  must be the value of a Crown, and as 4 Crowns and 3 Dollars are equal to 35s, therefore, from that sum deduct 22s the value of 4 Crowns, and the remainder will be 13s the value of 3 Dollars, whence 4s 4d (the  $\frac{1}{3}$  of 13s) must be the value of a Dollar.

A L L I-

# A L L I G A T I O N.

**B**Y *Alligation* you may find,  
When sev'ral simples are combin'd ;  
Or mix'd together so to be,  
Just of a middle quality.

## CASE I.

*When you are to resolve a Question in ALLIGATION MEDIAL which teaches how to find the mean rate of a mixture, when each particular quantity and their several rates are given, observe the following*

## R U L E.

Take care at first to multiply  
The quantities o'th' mixture by  
Their price respective, and divide  
The sum o'th' products next, (beside)  
By th' sum o'th' quantities you'll see  
The quotient the mean rate will be.

## EXAMPLE I.

Admit a Farmer would mix 20 Bushels of Wheat at 6s 8d per Bushel, with 36 Bushels of Rye at 4s 4d per Bushel. What would a Bushel of this Mixture be worth?

$$\begin{array}{r} 20 \\ 36 \end{array} \times \begin{array}{r} s \ d \quad f. \ s \ d \\ 6 \ 8 \\ 4 \ 4 \end{array} = \begin{array}{r} 6 \ 13 \ 4 \\ 7 \ 16 \end{array}$$

Sum 56

$$\begin{array}{r} 56 \\ \hline \end{array} \left\{ \begin{array}{l} 7 \ 14 \ 9 \ 4 \\ 8 \ 2 \ 1 \ 4 \end{array} \right.$$

Answer  $s \ 5 \ 2d$

the value of

the whole

8 Bushels

1 Bushel

of the Mixture.

20 Bu. of Wheat  
36 Bu. of Rye

EXAM-

**Exam-**

EXAMPLE 2.

Fat *Toby* well known for a merry old blade,  
 When cracking his jests at his fuddling trade,  
 Mix'd a cask of four diff'rent sorts of strong beer,  
 Whose prices will quickly be made to appear;  
 Twelve gallons at sixteen pence \* first he drew out,  
 Next nine gallons more of the beer he call'd *Stout*,  
 Which was charg'd at two shillings *per* gallon not less,  
 The value of which you may easily guess. *d*  
 Next ten gallons more at the rate † here subjoin'd, † 18 *d*  
 And six of the liquor which pleased his mind, *d*  
 Whose rate in the margin & you also may find. *d*  
 Now how much *per* gallon must th' liquor be sold  
 To *John, Ralph* or *Simon*, be pleas'd to unfold?

12	}	x	16	}	=	192	}	the value of	}	12	}	Gallons
9			24			216				9		
10			18			180				10		
6			20			120				6		
Sum 37			37) 708			19				whole		
Answer <i>d</i> 19 <sup>5</sup> / <sub>37</sub>										1 Gal. of the	Mixture.	

CASE 2.

When you are to resolve a Question in *ALLIGATION*  
*ALTERNATE*, (which is the reverse of *Alligation Medial*  
 and consequently may be proved thereby) observe the  
 following

R U L E.

The rates o'th simples, fair to fight,  
 In a column under each *one* write;  
 And the mean rate before let stand  
 Just opposite on the left hand.

L I

The

The sev'ral rates must linked be,  
*One* greater than the *mean* you see  
 To *one* or any numb'r of less,  
 Or otherwise, just the reverse;  
*One* less than the *compound one*, you  
 Link to a greater,—*Tyro*, true,  
 Or any number \*in your view.  
 To take the difference now prepare,  
 O'th' mean and rates whate'er they are,  
 Which opposite the rates you find,  
 Are link'd, or variously combin'd.

\* of greater rates

*Note.* It is plain from the abovementioned rule (as well as from an *algebraic* process from whence the Rule is derived) that all Questions of this Case are indeterminate and admit of various Answers, except such Questions that have but one Rate each, either greater or less than the mean, for such a Question will only admit of one way of linking, and consequently (by the Rule) will have but one Answer, tho' all Numbers that bear the same proportion between themselves as those that compose the Answer will also satisfy the condition of the Question, so that after one or more Answers are obtained by the Rule, you may find as many more as you please by increasing or decreasing the quantities in any proportion, or by only increasing or decreasing the quantities of any one or more *single* pairs of yoke-fellows in any proposition, and leaving the others as they are.

EXAMPLE I.

A Grocer wou'd mix Sugar at 11*d*, 6*d* and 5*d* per pound, so that the Composition may be worth 7*d* per pound. What quantity of each must be taken?

<i>d</i>	<i>lb</i>	<i>d</i>
$\begin{array}{r} 11 \\ 6 \\ 5 \end{array}$	$\begin{array}{r} 2, 1 \\ 4 \\ 4 \end{array}$	$\begin{array}{r} 3 \\ 4 \\ 4 \end{array}$
	at	$\begin{array}{r} 11 \\ 6 \\ 5 \end{array}$

Having first linked the several Rates agreeable to the Rule in

in

in the preceding page, (whereby it is plain that these Rates will admit but of this one way of linking) then the difference between 5 and 7 viz. 2 is placed against 11 its yoke-fellow, the difference between 6 and 7 is 1 which is also placed against 11 its yoke-fellow, and the difference between 7 and 11 is 4 which, because it has two yoke-fellows is placed against them both viz. against 6 and 5, so that as oft as the Grocer takes 3 <sup>lb</sup> at 11d a pound, he must take 4 <sup>lb</sup> of each of the other two sorts to make up the Mixture.

EXAMPLE 2.

Old Merry the Miller, won'd mix as we find,  
What Corn you observe in the margin \* subjoin'd.  
How much of each sort will exactly agree  
To be sold at five shillings per bushel tell me?

$$\begin{array}{l} \text{Wheat} \\ \text{Rye} \\ \text{Beans} \\ \text{Barley} \end{array} \left. \vphantom{\begin{array}{l} \text{Wheat} \\ \text{Rye} \\ \text{Beans} \\ \text{Barley} \end{array}} \right\} \text{at } \left\{ \begin{array}{l} 6 \text{ } 8 \\ 5 \text{ } 6 \\ 4 \text{ } 4 \\ 9 \text{ } 8 \end{array} \right\} = \left\{ \begin{array}{l} 180 \\ 66 \\ 52 \\ 44 \end{array} \right\} \text{ per Bushel}$$

$$60 \left\{ \begin{array}{l} \text{Wheat } 80 \\ \text{Rye } 66 \\ \text{Beans } 52 \\ \text{Barley } 44 \end{array} \right\} \left\{ \begin{array}{l} 16 \\ 8 \\ 6 \\ 20 \end{array} \right\} \text{ Bushels of } \left\{ \begin{array}{l} \text{Wheat} \\ \text{Rye} \\ \text{Beans} \\ \text{Barley} \end{array} \right.$$

The several Rates being linked together, then the difference between 44 and 60 viz. 16, is placed against 80 its yoke-fellow, the difference between 52 and 60 which is 8, is placed against 66 its yoke-fellow, the difference between 60 and 66 is 6, which is placed against 52 its yoke-fellow, and the difference between 60 and 80 is 20, which is placed against 44 its yoke-fellow, so that 16 Bushels of Wheat, 8 of Rye, 6 of Beans, and 20 of Barley at the respective prices above-mentioned will compose the Mixture required. Or, if

you were desirous to make up a less Mixture than the above, as suppose a quarter part, then divide the several differences or quantities by 4 and the Answer will be 4 Bushels of Wheat, 2 of Rye,  $1\frac{1}{2}$  of Beans, and 5 of Barley, which numbers being in the same proportion between themselves as the abovementioned differences are, will therefore compose the required Mixture.

*d*  
 $\begin{array}{l} \text{Wheat } 80 - \\ \text{Rye } 66 - \\ \text{Beans } 52 - \\ \text{Barley } 44 - \end{array} \left| \begin{array}{l} 8 \\ 16 \\ 20 \\ 6 \end{array} \right.$  *OR*, if 80 and 52 be linked together, and 66 and 44, and the differences placed respectively, the Answer (you see) will be 8 Bushels of Wheat, 16 of Rye, 20 of Beans and 6 of Barley. *Or*, suppose you wou'd have twice as much Wheat in the Mixture as this way of linking the Rates produces, and but  $\frac{1}{2}$  part of the Rye, then (according to the *Note* in page 398) double the quantity of Beans as well as the Wheat (their prices being yoke-fellows) and also take as well  $\frac{1}{2}$  part of the Barley as the Rye (they being yoke-fellows) and the Answer will be 16 Bushels of Wheat, 2 of Rye, 40 of Beans and 3 Pecks of Barley.

*d*  
 $\begin{array}{l} \text{Wheat } 80 - \\ \text{Rye } 66 - \\ \text{Beans } 52 - \\ \text{Barley } 44 - \end{array} \left| \begin{array}{l} 16, 8 \\ 16 \\ 20 \\ 6, 20 \end{array} \right. \left| \begin{array}{l} 24 \\ 16 \\ 20 \\ 26 \end{array} \right.$  *AGAIN*, if 80 be linked both with 52 and 44, and 66 with 44, and the differences placed respectively, the Answer (you see) will then be 24 Bushels of Wheat, 16 of Rye, 20 of Beans and 26 of Barley.

*d*  
 $\begin{array}{l} \text{Wheat } 80 - \\ \text{Rye } 66 - \\ \text{Beans } 52 - \\ \text{Barley } 44 - \end{array} \left| \begin{array}{l} 16, 8 \\ 16, 8 \\ 6, 20 \\ 6, 20 \end{array} \right. \left| \begin{array}{l} 24 \\ 24 \\ 26 \\ 26 \end{array} \right.$  *ALSO*, if 80 be linked both with 52 and 44, and 66 both with 52 and 44 and the differences placed respectively (remembering that if any Rate have two yoke-fellows it will have two differences)

differences) the Answer (by this way of linking) will be 24 bushels of Wheat, 24 of Rye, 26 of Beans and 26 of Barley, and that all these different Answers will compose the Mixture required is easily proved by *Case 1* of this Rule, and thus you see innumerable Answers to any Question of this kind may be easily obtained.—There are other ways of linking the Rates of this Example, but these already given are quite sufficient to shew the method, and as I have been so copious in explaining this Example, I shall therefore in each of the following ones in this Rule that will admit of being variously linked, shew but one way and consequently obtain but one Answer thereto.

**CASE 3.**

*When you are to resolve a Question in Alligation Partial, viz. where one of the quantities to be mixed is given, observe the following RULE.*

As th' difference that's standing fair,  
Against the price o'th' given ware  
Or quantity, whate'er it be,  
Is to the given quantity;  
So are the other differences,  
To the respective quantities.

**EXAMPLE 1.**

Admit a Miller wou'd mix 20 Bushels of Wheat at 5s 6d per Bushel, with Rye at 4s and Barley at 3s, and would sell the same out again at 4s 6d per Bushel. How much Rye and Barley must he take?

24	{	Wheat 66	}	18,6	24
54	{	Rye 48	}	12	12
	{	Barley 36	}	12	12

As 24:20:: $\left| \begin{smallmatrix} 12 \\ 12 \end{smallmatrix} \right|$ : $\left| \begin{smallmatrix} 10 \\ 10 \end{smallmatrix} \right|$  Rye to be mix'd with  
Barley the 20 of Wheat.

*Note.* All Examples that belong to this and the following Case may be easily proved by the Rule in page 396, viz. *Alligation Medial.*

EXAMPLE 2.

Suppose I was to mix up a canister of Tea to contain 30 lb of 5 different prices, viz. of 4s, 5s, 7s 6s and 10s per lb, so as to make the Mixture worth 8s per lb. How much of each sort must I take?

	lb	lb	lb	lb	lb
10	4	4	4	10	4
9	1	4	4	10	1
7	1	1	1	2½	1
5	1	1	1	2½	1
4	2	2	2	5	2
Sum	12			30	

PROMISCUOUS QUESTIONS.

Question 1. by Mr. James Hardy.

A Hoghead of Wine that cost 15 Guineas, was lowered with Water, so that the Mixture cost 4s 6d per Gallon would just fetch the price of the Hoghead. What quantity of Water was added?

1 d. Gal. f. s.

As 4 6 : 1 :: 15 15 : 70 Gallons, from which deduct 63 (the number of Gallons in a Hoghead) and there will remain 7 Gallons, the quantity of Water that was added.

Question 2 by Mr. Edward Coker.

A Goldsmith hath Gold of 4 several sorts of fineness, viz. of 24 Carats fine, and of 22 Carats fine, of 20 Carats fine, and of 15 Carats fine, and he would mingle so much of each with Alloy, that the whole Mass of 28 Ounces of Gold so mingled may bear

bear 17 Carats fine. I demand how much of each he must take ?

$\begin{array}{r} 24 \\ 22 \\ 20 \\ 15 \\ 0 \end{array}$	$\begin{array}{r} 17 \\ 2 \\ 2 \\ 3.5 \\ 7 \end{array}$	$\begin{array}{r} 17 \\ 2 \\ 2 \\ 8 \\ 7 \end{array}$	$\begin{array}{r} \text{oz} \quad \text{oz} \\ \text{As } 36:28:: \end{array}$	$\begin{array}{r} \text{oz.} \quad \text{oz.} \\ \left( \begin{array}{r} 17 \\ 2 \\ 2 \\ 8 \\ 7 \end{array} \right) \end{array}$	$\left( \begin{array}{r} 13.5 \\ 1 \\ 1 \\ 6 \\ 5 \end{array} \right)$	$\left. \begin{array}{c} \text{the} \\ \text{Quantity of} \end{array} \right\} \begin{array}{r} 24 \\ 22 \\ 20 \\ 15 \\ 0 \end{array}$	$\left. \begin{array}{c} \text{Car. fine.} \\ \text{Alloy} \end{array} \right\}$	$\left. \begin{array}{c} \text{wh. qty,} \end{array} \right\}$
$\text{Sum } 36$			$28$					

*Note.* In Mixtures it sometimes happens (as above) that one ingredient bears no value but is used only to increase the quantity or diminish its worth, and therefore must be represented by a cypher, as Water mix'd with Wine, Copper or other Alloy with Gold or Silver.

## ARITHMETICAL PROGRESSION.

**T**HIS Rule directs you very fair,  
When any ranks of numbers are  
Increasing or decreasing by  
A common difference low or high.

A *Series of Progressionals* (or as some call 'em *Arithmetical Proportionals*) is a rank of numbers (above two) that follow each other increasing or decreasing regularly by a *Common Difference*.

Hence

1, 2, 3, 4, 5, 6	<i>is a Rank or Series of Progressionals</i>	increasing	<i>by the Common Difference</i>	1
6, 5, 4, 3, 2, 1		decreasing		1
1, 3, 5, 7, 9, 11 and		increasing		2
30, 25, 20, 15, 10, 5		decreasing		5

The

The *Numbers* that compose a *Rank* or *Series* of *Progressionals* are called its *Terms*, whereof the *first* and *last* are called *Extremes*, and any two equally distant from them *Means*.—Now when the Number of the *Terms* is even, the *Sum* of the *Extremes* is equal to the *Sum* of any two *Means* that are at equal distance from such *Extremes* thus, in the Series 3, 4, 5, 6. the *Sum* of the *Extremes* 3 and 6, is equal to the *Sum* of the *Means* 4 and 5.—And if the Number of *Terms* in the *Series* be odd, twice the middle *Term* or *Mean* is always equal to the *Sum* of the *Extremes*, so in this Series 4, 10, 16, 22, 28, the double of the *Mean* 16, is equal to the *Sum* of the *Extremes* 4 and 28.

There are 5 things to be observed in *Arithmetical Progression*, viz.

- |    |   |               |   |                   |   |                      |
|----|---|---------------|---|-------------------|---|----------------------|
| 1. | { | first         | } | Term commonly the | { | least                |
| 2. |   | last          |   |                   |   | greatest             |
| 3. | { | The           | } | Number of Terms   |   |                      |
| 4. |   |               |   |                   |   |                      |
| 5. | { | Common Excess | } | or                |   | Sum of all the Terms |
|    |   | Aggregate     |   |                   |   |                      |

Any three of these being given the other two may be easily found.

### PROPOSITION I.

When the first Term, Number of Terms and Common Excess are given to find the last term.

#### RULE.

The Common difference subtract  
 From th' number of Terms (to be exact)  
 When multipl'd by th' common excess,  
 Let it be more, or be it less,  
 Th' remainder added to th' first Term,  
 Will give the last I can affirm.

Or, Multiply the Number of Terms *minus* Unity by the Common Excess, to the Product add the first Term, and the Sum will be the last Term.

EXAM-

## EXAMPLE.

What is the last Term of an *Arithmetical Progression* or *Series* beginning at 4 and continuing by the increase of 2 to 60 places?

First  $60 \times 2 = 120$ , and  $120 - 2 = 118$  Then  $118 + 4 = 122$  the last Term required.

## PROPOSITION 2.

When the first and last Terms (*viz.* the two Extremes) and Number of Terms are given to find the Sum of all the Terms in Series.

## RULE:

The Sum o'th' Extremes multiply  
Into half the Number of Terms that's by  
And th' answer quickly you'll descry

## EXAMPLE 1.

How many Strokes does the Hammer of a Clock strike in 12 Hours?

$1 + 12 = 13$  the Sum of the Extremes  
6 half the Number of Terms

Answer 78 Strokes.

Or,

$$\frac{1 + 12}{2} = 6.5$$

78 Ans.

$$1 + 12 = 13$$

2) 156

78 Ans.

## EXAMPLE 2.

Near Newhall mill was lately made  
A wager by a Taylor,

One.

One hundred Stones to gather up,  
As told me by a *Sailor*.

To do the feat he was allow'd

In minutes *Forty-five*,

Just *Johnny Wilkes's* number fair,

'Tis true as I'm alive.

Right, in a line the Stones were plac'd

Exact a yard afunder,

How many miles then did he run,

To gather up that number?

And tell me *Tyro* if you please,

From what is here subjoin'd †

Exact the time the *Taylor* run

To please his anxious mind

It's very plain from the Question that twice the Sum of the Series, whose first Term and Common Difference are 1, and number of Terms 100 will be the Distance required, therefore

	<i>Yds.</i>	<i>Miles</i>	<i>Yds.</i>	
$1 + 100 \times 100 = 10100 = 5 \frac{1}{4}$			wanting 20	} $\left. \begin{array}{l} \text{Dist.} \\ \text{Time} \end{array} \right\} 129.$
$10100 : 40 :: 10100 : 40 \frac{40}{3079}$	<i>Yds.</i>	<i>F. Min.</i>	<i>Yds.</i>	

And then As 252  $1 \frac{1}{2} : 1 :: 10100 : 40 \frac{40}{3079}$

**PROPOSITION 3.**

When the first Term, Number of Terms and Common Excess are given to find the Sum of all the Terms of Series.

**RULE.**

Th' Number of Terms by th' common Excess

Multiply,—and th' Product make less

By th' common Difference, and to

What's left, add twice th' first Term also.

Then half of that Sum multiply

By th' Number of Terms and you'll espy

The Sum of all,—the Series true,

As underneath I'll quickly shew.

† e. To gather them singly and put them into a Basket. † 252 Yds. 1 Et. 3 Inches per Minute.

**EXAM-**

## EXAMPLE.

Suppose I agree with a Pump-maker to sink a Well 20 Yards deep and am to pay him 1s for the first Yard, 3s for the second, 5s for the third, and so on raising 2s every Yard. What will the whole amount to?

The Number of Terms multipl'd by the common Difference produces 40, from which deduct 2 the common Difference or Excess, and the remainder will be 38, which add to twice the first Term, viz. 2 and the sum will be 40, half of which is 20, which multiplied by 20 the Number of Terms produce 400 Shillings = £20 the Answer.—Or, If you add the above-mentioned Remainder 38 to the first Term only, according to *Proposition 1, page 405*, (and not to the double of the first Term) the Sum will be 39 the last Term, and then there will be given the first Term, last Term, and Number of Terms as in the preceding *Proposition, page 406*, to find the Sum of the Series and therefore the Remainder 38 being added (as above) to twice the first Term gives the Sum of the Extremes and consequently by any of the methods in the said next preceding *Proposition* the Answer will be easily found to be £20 as above.

*Note.* When the first Term and common Difference of any Arithmetical Series are each of them an Unit, then it is plain from the first mentioned Series in *page 404*, that the Number of Terms and last Term of such Series will always be equal to each other, as in *Example 1 page 406*, for the first Term and common Difference being each an Unit, therefore the Number of Terms and last Term are both equal viz 12:—But if either the first Term or common Difference in any ascending Arithmetical Series be more than an Unit, then the last Term thereof will always be greater than its Number of Terms as in the *Example*

*ple* in this *Proposition* the number of terms is 20 but as the common difference is greater than an Unit *viz.* 2, therefore 39 is the last term as is easily found by *Proposition 1* in page 405.

PROPOSITION 4.

*When the first and last Terms viz. the two Extremes, and Number of Terms are given to find the Common Difference or Excess.*

R U L E.

The Diff'rence of the two extremes,  
Divide by the number of Terms  
Less one—and the Quotient will be,  
The common Diff'rence you will see.

EXAMPLE.

A *Cooper* who loved to smoke and to drink,  
A Debt had to pay but was short of the *chink*,  
In Arithmetical Progression agreed for to pay  
The Sum at twelve diff'rent payments they say,  
Th' first payment two Shillings the last just a score,  
The whole Debt young *Tyro* with ease you'll explore  
And what was the Sum of each payment agreed  
By the *Cooper* to pay?—Come tell me with speed.

From 20 the greater Extreme take 2 the less Extreme and the remainder will be 18 which divide by 11 *viz.* the number of Terms less 1, and the Quotient will be  $1\frac{7}{11}$  = 1s 7d  $\frac{7}{11}$  the common Excess or Increase, which add to each payment and the whole Debt will be found to be £6 12s as is also plain from either of the two *Propositions* in pages 406 and 407.

PROPOSITION 5.

*When the first and last Terms viz. the two Extremes and Common Excess are given to find the Number of Terms.*

M m

R U L E.

## R U L E.

The Diff'rence o' th' Extremes divide  
 By th' common Excess, to th' Quote beside  
 Add Unity,—the Sum will be  
 Th' number of Terms as you will see.

## EXAMPLE.

Admit a Man was to go a journey and his first day's travel to be 6 Miles and the last 60, every day encreasing his journey by 4 Miles. How many days would he be in compleating the same.

*First*  $60 - 6 = 54$  the Difference of the Extremes *Then* divide 54 by 4 the Common Excess, and the Quotient will be  $13\frac{1}{2}$ , to which add 1 and the Sum will be  $14\frac{1}{2}$  days the Answer.

## P R O P O S I T I O N 6.

*When the last Term, Number of Terms and Common Excess are given to find the first Term.*

## R U L E.

Th' common Excess first multiply  
 By the number of terms less unity,  
 The product from th' last Term subtract,  
 And the Result's the first in fact.

## EXAMPLE.

A Gentleman to bestow his Charity takes out of his Pocket a certain number of halfpence which he gives to 12 poor persons, every one receiving 3 more than the former. What had the first when the last receiv'd two Shillings and what was the Sum the Gentleman bestow'd?

*First*

*First* The number of Terms less 1 viz. 11 multipl'd by 3 the common Excess produces 33 which deduct from 48 the halfpence in 2s and the remainder will be 15 halfpence =  $7d\frac{1}{2}$  the sum the first person receiv'd Then by *Proposition 2*, page 406, or by *Proposition 3*, page 407; it may be easily known that 15s 9d. was the whole sum that the Gentleman gave away.

PROPOSITION 7.

*When the Number of Terms, Common Excess and Sum of all the Series are given to find the first Term.*

R U L E.

The sum of all the Terms divide  
By th' number of Terms, and beside  
From the Quotient, subtract (not less  
Than) half th' product of th' common Excess  
Into th' number of Terms less Unity,  
Th' remainder will the first Term be.

EXAMPLE

*Humbly address'd to all ingenious young Ladies.*

Near Nantwich town now lives a charming Fair,  
Thither ye blooming Maids in haste repair,  
There learn the force of Wit and Beauty's Charms,  
And Virtue hourly guarding her from Harms,  
There learn t' admire superior Reason Sense,  
The pow'r of Wisdom and of Eloquence!  
All you can wish in this bright Maid combine,  
To make her lovely and appear divine!  
Well vers'd in figures is this charming Maid,  
Minerva smiling gives her all her Aid,  
Instructs the Fair as Damon well can prove,  
Such heav'nly pow'rs make Man do more than love.

Ye brill'ant *Fair* who with this Maid can vie,  
 Learn from her precepts, imitate and try  
 To work th' Example which the *Swain* did poze,  
 The task is nothing to the fairest Muse.

### QUESTION.

This amiable *fair One*, being in company with a very agreeable young Gentleman, told him that in  $2\frac{1}{2}$  years she shou'd receive the whole of her fortune, which was £1000. that next quarter's day she shou'd receive the first payment and each payment after wou'd exceed the former by £20. "Now Sir" (says she, smiling on the young Gentleman) "I am free to give you the first payment, provided, you will tell me what it is from the given *Data*", but the young Gentleman being unskill'd in numbers cou'd not comply to her proposal, but leaves it to the study of the *fair-sex* to resolve the Question, and tell him the first payment.

*First* divide 1000 the Sum of the Series, by 10 the number of Terms *i e* the Quarters in  $2\frac{1}{2}$  years and the Quotient will be 100. *Then* from 10 deduct 1 and the remainder will be 9 which multiplied by 20 the common Excess will produce 180, half whereof is 90 which deduct from the above mentioned Quotient 100, and the remainder will be £10 the Answer.

*Or* multiply the number of Terms by the common Difference, and that product by the number of Terms less an Unit, subtract the last product from twice the Sum of the series and divide the remainder by twice the number of terms; and the Quotient will be the least Term.

*See the Work.*

$$\begin{array}{r} \text{From } 1000 \times 2 = 2000 \\ \text{Take } 10 \times 20 \times 9 = 1800 \\ \hline \text{Divisor } 10 \times 2 = 20 \quad \overline{200} \end{array}$$

£10 the Answer as above.

PRO-

PROPOSITION 8.

*When one person or thing moves with an equal and another the same way by a progressive motion, to find in what time the first will be overtaken.*

R U L E.

To twice the space gone o'er each day  
By the pursu'd, mind what I say  
Add th' common Excess, be what it will  
O'th' pursuer's days journey, mind me still,  
From th' Sum take twice the space gone o'er  
By the pursuer the first day——more  
Divide th' result by th' common Excess  
Th' Quote will th' number of days express  
As the pursu'd will be o'erta'en  
As quickly now I shall explain.

EXAMPLE

Suppose a Highwayman (such as the late noted *Turpin*) committed a Robbery and suspecting a pursuit rode off at the rate of 40 miles a day, now suppose a Thieftaker follow'd him in a progressive motion and rode 30 miles the first day, 34 the next and so on encreasing 4 miles every day. In how many days wou'd the Highwayman be overtaken?

*First*, 40 multipli'd by 2 produces 80 to which add 4 the common Excess and the Sum will be 84. *Then* from 84 deduct 60 viz. twice the Space the Pursuer was supposed to ride the first day, and the remainder will be 24 which divided by 4 (the common Excess) quotes 6 the answer, as may be easily proved, for  $6 \times 40 = 240$  which by *Proposition 3*, page 407, will be readily found to be the Sum of *that Series* whose first Term is 30, Number of Terms 6, and Common Excess 4, and therefore proves the above work to be right.

## GEOMETRICAL PROGRESSION.

**G**EOMETRICAL PROGRESSION shews  
 When Ranks of Numbers we suppose  
 To increase by equal Ratios—or  
 Decrease the same in Number,—for  
 Common Multipliers plainly shew  
 And Divisors too—the Ratio.

A Series of Proportional Numbers, or *Proportionals* (by some called *Geometrical Proportionals*) is a Rank of Numbers (above two) that succeed each other increasing or decreasing regularly by a *Common Multiplier* or *Divisor*.

Hence

1,	3,	9,	27,	81	} is a Rank or Series of Proportionals	{ inc. }	} by the Common	{ Mult. }
81,	27,	9,	3,	1				
2,	8,	32,	128,	512		{ inc. }		{ Mult. 4 }
and .								
625,	125,	25,	5,	1				

In any rank of Numbers in *Geometrical Progression*, the first and last Terms are call'd *Extremes* and any two equally distant from them *Means* the same as in *Arithmetical Progression* see page 405. Now when the Number of Terms of any *Geometrical Series* is even, it is plain that the *product* of the *Extremes* is always equal to that of every two *Means* that are equally distant from them, as in the Series

4, 8, 16, 32, ) the product arising from the { Extremes 4 } and { 32 viz. 128  
 is equal to { Means 8 } and { 16. — And if

the Number of Terms of any *Geometrical Series* be odd, then the *Square* of the *Mean* or *middle Term* is always equal to the *Product* of the two *Extremes* or  
 to

to that of any two Means equally distant from the Mean or middle Term, as in the Series 3, 12, 48, 192, 768 the Square of 48 the Mean viz. 2304 is equal to the Prod. arising from the 2 Extrs. 3 & 768 or 12 & 192

There are 5 things to be observed in a Geometrical Series (as well as an Arithmetical One) viz.

1. { first } Term commonly the { least
2. { last } { greatest
3. { The } Number of Terms
4. { Ratio
5. { Aggregate or Sum of all the Terms.

Any three of these being given the other two may be easily found.

### PROPOSITION I.

When Unity is the first Term, and the Ratio and Number of Terms are given to find the last Term without producing all the intermediate Terms.

#### RULE.

A few of the leading Terms first find,  
 O'er which place th' Indices† to your mind.  
 Then find what figures of the Indices,  
 When added together true, that is, —  
 Will give th' Index o' th' Term that's sought,  
 Then multiply the Numbers wrote  
 Under such Indices, into  
 Each other, and the Product 'll shew  
 The Term requir'd, as soon you'll know.

*Note.* You must take care to remember that the Sum of the Indices is always 1 less than the Number

---

† Indices or Exponents are a Series of natural Numbers which proceed from Unity or 1, and shew the places of the Terms of the Progression.

of Terms, because the Indices begin with a Cypher, and therefore

The Index  $\left\{ \begin{array}{l} 1 \\ 2 \\ 3 \\ 4 \\ \&c. \end{array} \right\}$  always stands over, and consequently denotes the  $\left\{ \begin{array}{l} 2^d \\ 3^d \\ 4^{th} \\ 5^{th} \\ \&c. \end{array} \right\}$  Term, as is manifest in all the Examples in *this* and the two following Propositions.

## EXAMPLE.

Once *Country Ralph* a Horse did buy,  
 'Twas of a Sharper *Obed Sly*,  
 And by agreement was to pay,  
 What the last Nail came to they say,  
 A Farthing for the first Nail he  
 Agreed to pay, th' second must be  
 Doubled,—so on to th' Number eight. †  
 Come *Tyro* now you'll tell me straight,  
 What *Ralph* was t' pay—the Sharper's claim  
 This do, and mount aloft to *Fame*.

† 4 Shoes and 8 Nails in each.

First  $\left\{ \begin{array}{l} 0, 1, 2, 3, 4, 5, 6, 7, 8 \text{ Indices or Exponents} \\ 1, 2, 4, 8, 16, 32, 64, 128, 256 \text{ Terms} \end{array} \right.$

and  $\left\{ \begin{array}{l} 7 + 7 = 14 \\ 128 \times 128 = 16384 \end{array} \right.$  the 14th Index or Exponent  
 and consequently the 15th Term.

Then  $\left\{ \begin{array}{l} 14 + 14 = 28 \\ 16384 \times 16384 = 268435456 \end{array} \right.$   $\left\{ \begin{array}{l} 2 \\ 8 \\ 3 \end{array} \right.$  the Index, and consequently the 29th Term.  
 $\left\{ \begin{array}{l} 29^{th} \\ 4^{th} \\ 32^d \end{array} \right.$

Or

Or thus

$$\text{First} \left\{ \begin{array}{l} 7 + 8 = 15 \\ 128 \times 256 = 32768 \\ \hline 2 \\ \hline 65536 \end{array} \right\} \text{the} \left\{ \begin{array}{l} 15^{\text{th}} \\ 1^{\text{st}} \\ \hline 16^{\text{th}} \end{array} \right\} \text{Index, and} \text{consequent-ly the} \left\{ \begin{array}{l} 16^{\text{th}} \\ 2^{\text{d}} \\ \hline 17^{\text{th}} \end{array} \right\} \text{Term.}$$

Then  $\left\{ \begin{array}{l} 15 + 16 = 31 \\ 32768 \times 65536 = 2147483648 \end{array} \right.$  the same as in the preceding page being the 32d, or last Term in Farthings, which make £2236962 2s 8d the price of the Horse or last Nail.

Too much by far, for honest *Ralph* to pay,  
Who shou'd take care of Sharpers in this way,  
An honest man may easily be undone,  
By giving way to such a Sharper's Pun.

*Note.* The abovementioned sum of £2236962 2s 8d you see is only the price of the last Nail, but the Sum of the Terms viz What all the 32 Nails will amount to, may be easily known by *Proposition* the 3d in page 418 to be 4294967295 Farthings = £4473924 5s 3d  $\frac{3}{4}$ .

## PROPOSITION 2.

When the first Term of any Geometrical Series is greater than Unity, and that Term, the Number of Terms and Ratio are given to find the last Term without producing all the intermediate Terms.

### R U L E.

Here as in Rule the last proceed,  
Only in this, you must take heed,  
Ev'ry Product must divided be  
By the first Term, the Quote you'll see.  
Will with the Term requir'd agree.

EXAM-

## EXAMPLE.

Suppose a person had 9 Sons and leaves the youngest £100, the next as much and half as much, and so every Son to exceed the next younger by the equal Ratio of  $1 \frac{1}{2}$ . What is the eldest Son's share?

$$\text{First } \left\{ \begin{array}{l} 0, \quad 1, \quad 2, \quad 3, \quad 4 \text{ Indices} \\ 100, 150, 225, 337.5, 506.25 \text{ Terms} \end{array} \right.$$

$$\text{and } \left\{ \begin{array}{l} 4 \quad + \quad 4 \\ 506.25 \times 506.25 = 256289.0625. \end{array} \right.$$

Then divide 256289.0625 by 100 the first Term and the Quotient will be  $2562.890625 = £2562 \text{ } 17s \text{ } 9d \frac{3}{4}$  the Answer.

## PROPOSITION 3.

When the first Term, Number of Terms and Ratio are given to find the Sum of all the Terms or Series.

## R U L E.

Now find the last Term as before,  
From which deduct the first, not more,  
Th' remainder by th' Ratio divide  
Less one — And to that Quote beside,  
Add the last Term, and you will find  
The Sum required to your mind.

Hence it is plain that in any finite Geometrical Progression it holds

$$\begin{array}{l} \text{As } \left| \begin{array}{l} 0 \\ 2 \end{array} \right| \text{Ratio minus Unity} \quad \left| \begin{array}{l} 0 \\ 2 \end{array} \right| \text{Unity} \\ \text{Or, As } \left| \begin{array}{l} 2 \\ 2 \end{array} \right| \text{Diff. o' th' 2 greatest Terms} \quad \left| \begin{array}{l} 2 \\ 2 \end{array} \right| \text{the greatest} \end{array}$$

$$\text{the } \left\{ \begin{array}{l} \text{Diff. of the greatest and} \\ \text{least Terms.} \\ \text{greatest minus the least} \end{array} \right\} \text{to the Sum of all except the } \left\{ \begin{array}{l} \text{greatest.} \\ \text{least.} \end{array} \right.$$

EXAM-

EXAMPLE 1.

Fair *Chloe's* married to a 'Squire,  
 Who does her beauteous form admire.  
 Her Father whimsical inclin'd,  
 His Daughter portion'd thus we find,  
 Ten Shillings on the wedding Day,  
 And doubled ev'ry Month they say,  
 For one whole Year, what was the Sum?  
 Come *Tyro* work, the Answer'll come.

First { 0, 1, 2, 3, 4, 5, 6 Indices  
 { 10, 20, 40, 80, 160, 320, 640 Terms

and { 5 + 6  
 $320 \times 640 = 204800$  Then divide 204800 by  
 the first Term 10, and the Quotient will be 20480  
 the last Term, from which deduct the first Term and  
 (as the Ratio *minus* Unity is just an Unit, therefore)  
 to the remainder 20470 add 20480 the last Term, and  
 the Sum will be 40950 Shillings = £2047 10s the Ans.

Or, according to the first mentioned *Analogy* in the  
 preceding page. As the Ratio *minus* Unity viz. 1 is  
 to Unity or 1 so is 20470 the Difference of the greatest  
 and least Terms, to 20470 the Sum of all except the  
 greatest, Hence is manifest this

C O R O L L A R Y

That if the Ratio of any Rank or Series of Proportional  
 be double, the Difference of the greatest and  
 least Terms is equal to the Sum of all except the  
 greatest, if the Ratio be triple, the Excess or Difference  
 is double the Sum of all except as aforesaid, if  
 quadruple, triple, if quintuple, quadruple, and so on.

EXAMPLE 2.

Suppose a Labourer was to agree with a Farmer  
 to thrash his Barley be what Quantity it wou'd for 20  
 Years, upon condition he wou'd give him 4 Barley  
 Corns for the first Year, 12 for the second, 36 for the  
 third,

# Geometrical Progression.

third, and so on to the end of the 20 Years. What would his Wages amount to allowing 7680 Grains to a Pint, and 64 Pints to the Bushel and the whole Quantity to be worth 3s 10d per Bushel?

First { 0, 1, 2, 3, 4, 5 Indices  
4, 12, 36, 108, 324, 972 Terms

and { 5 + 5  
972 x 972 = 944784 which

Then { 10 + 10  
236196 x 236196 = 55788550416 which  
and the 21st Term viz. 13947137604

divided by the first Term  
quotes  
236196  
13947137604  
4649045868

the 10th Index, and consequently the 11th Term.

Or thus,

First { 4 + 5  
324 x 972 = 314928 which

and { 9 + 9  
78732 x 78732 = 6198727824 which

divided by 4 the 1st Term  
quotes  
78732  
1549681956  
3

the 9th Index and consequently the 10th Term.

4649045868

Then (according to the *Rule* and also to the *first Analogy* in page 418, they being both one and the same in effect) deduct 4 the first or least Term from 4649045868 the last or greatest Term, and divide the remainder 4649045864 by 2 *viz.* the Ratio less 1, and the Quotient will be 2324522932 the Sum of all the Terms except the last or greatest, to which add 4649045868 the last or greatest Term, and the Sum will be 6973568800 the Sum of all the Terms or the whole Number of Barley Corns.

*O R.* according to the *second Analogy* in page 418.

As  $4649045868 - 1549681956 = 3099363912$  *viz.* the difference of the 2 greatest Terms, is to 4649045868 the greatest Term, so is  $4649045868 - 4 = 4649045864$  *viz.* the greatest Term *minus* the least, to 6973568796 the Sum of all the Terms except the least, to which add 4 the least Term, and the Sum will be 6973568800 the Number of Barley Corns the same as before, which divide by  $491520 = 7680 \times 64$ , and the Quotient will be  $14187 \frac{2341}{3672}$  *viz.* 14187 Bushels and a little more than 3 Pecks, which at 3s 10d a Bushel amount to £2719 6s 5d the Answer.

# PROPOSITION 4.

When the first Term and Ratio of any infinite decreasing Geometrical Series or infinite Series of decreasing Proportionals are given to find the Sum of the Series.

## RULE.

Divide the Square o' th' first Term true,  
By th' diff'ence, which the first doth shew  
And th' second Term i' th' Series too. }  
This done, the Quotient will appear  
The Sum o' th' Series very clear.

N n

A Geo.

A *Geometrical Series* that decreaseth *ad infinitum* or in other words an *Infinite Series* of decreasing *Proportionals* is such whose *last* or *least Term* is a *Cypher* or less than any thing assignable, and its *Number of Terms* *inexpressible*; and that the *Sum* of such a *Series* whose several *Terms* are *utterly impossible to be expressed* can be so easily known as is set forth in the *Rule* in the preceding page, or indeed known at all! seems *VERIWONDERFUL*! but that it may be so easily done is plain from the *second Analogy* in p. 418 viz. As the difference of the two greatest *Terms*, is to the greatest, so is the greatest *minus* the least, to the *Sum* of all except the least. Now as in an *infinite decreasing Series* the last or least *Term* is a *Cypher* (as above) therefore there is nothing to be subtracted from the greatest *Term*, and consequently in such a *Series* it must be, As the difference of the two greatest *Terms* is to the greatest, so is the greatest, to the *Sum* of all, whence is derived the *Rule* in the preceding page.

Or the *Sum* of such a *Series* may be known by the following *Analogy*, viz. As the difference of the two first or greatest *Terms*, is to the second *Term*, so is the first or greatest *Term*, to the *Sum* of all the others *ad infinitum*.

#### EXAMPLE.

Find the *Sum* of the *Series*  $\frac{1}{4}, \frac{1}{16}, \frac{1}{64}, \frac{1}{256}$  &c. *ad infinitum*.

First  $\frac{1}{4} \times \frac{1}{4} = \frac{1}{16}$ , and  $\frac{1}{4}$  (viz.  $\frac{4}{16}$ )  $— \frac{1}{16} = \frac{3}{16}$ .

Then  $\frac{3}{16} \div \frac{1}{16} (\frac{16}{16} = \frac{1}{1})$  the Answer.

Or (according to the last mentioned *Analogy*) As  $\frac{3}{16}$  the difference of the two first or greatest *Terms*, is to  $\frac{1}{16}$  the second *Term*, so is  $\frac{1}{4}$  the first or greatest *Term*, to  $\frac{16}{16} = \frac{1}{1}$  the *Sum* of all the *Terms* except the first or greatest, to which add  $\frac{1}{4}$  the first or greatest, and the *Sum* will be  $\frac{4}{4} = \frac{1}{1}$  the Answer as before.

PRO-

## PROMISCUOUS QUESTIONS.

## Question 1.

From Mr. *Donn's* Arithmetic, page 209.

A Gentleman as he did ride  
 Near to a pleasant Common side,  
 Ten Shepherdesses chanc'd to meet,  
 Driving their Flocks, whom he did greet,  
 God speed you well; and may you be  
 As happy as you're fair (said he :)  
 Prosper your Flocks, and may they thrive;  
 Tell me how many Sheep you drive?  
 One of the Damsels straight reply'd,  
*Sir*, you shall soon be satisfy'd.  
 For if for one of us you do  
 Count one Sheep, for the next count two,  
 For the third four, for the fourth eight,  
 So doubling at each Maid aright,  
 At the last Maid the Sum will be,  
 As many as the Sheep you see.

*Quere* the Number of the Sheep?

*First*  $\left\{ \begin{array}{l} 0, 1, 2, 3, 4, 5 \text{ Indices} \\ 1, 2, 4, 8, 16, 32 \text{ Terms} \end{array} \right.$

and  $\left\{ \begin{array}{l} 4 + 3 = 7 \\ 16 \times 32 = 512 \end{array} \right.$  the Number of Sheep requir'd.

*Or thus,*

$$4 + 3 + 2 = 9$$

therefore  $16 \times 8 \times 4 = 512$  as before, and here we may observe that whatever Indices we take whose Sum is under the last Term, the powers of the Ratio under such Indices multiplied into each other will be equal to the power of the Sum of such Indices or Exponents.

*N<sup>o</sup> 2*

*Quef*

## Question 2. by Mr. John Newbold.

From Mr. *Tipper's Delights for the Ingenious*,  
published in 1711.

Suppose a round Ball for to move in the Air,  
In a certain proportion which I shall declare;  
Let the first Hour be 12 Miles, the next to move 10, }  
And so in proportion from whence it began, }  
As 12 is to 10, now try if you can  
Tell the Miles it will move, suppose it to be  
Continued in Motion to *ETERNITY*!

*First*  $12 \times 12 = 144$ , and  $12 - 10 = 2$ . Then divide  
144 Miles by 2 and the Quotient will be 72 Miles the  
Answer.

*Or*, As 2 the difference of the two greatest Terms,  
is to 10 the second Term, so is 12 the first or greatest  
Term, to 60 Miles the Sum of all the Terms except  
the first or greatest, to which add 12 Miles the greatest  
Term, and the Sum will be 72 Miles the Answer the  
same as above.

## P E R M U T A T I O N.

**T**HIS *Rule* will shew you instantly,  
How th' order of things may varied be,  
With respect to place, as you will see. }

## R U L E.

All th' given Series multiply  
One into another continually.  
Then the last product points out fair  
The Answer true, I do declare.

EXAM-

EXAMPLE 1.

At *Whitchurch* we've a Church that's nearly new,  
Which beauteous Pile, can be outvi'd by few:  
Here sacred Grandeur, captivates the Eye,  
Trav'lers admire the fame, as they pass by;  
To grace this Structure, there's a lofty Tow'r,  
With eight fine Bells, which harmonize each Bow'r:  
How many Changes may be rung declare,  
On these eight Bells, and likewise tell me fair,  
How long they wou'd be ringing them once o'er,  
Allowing eight Seconds *per* Change, not more?

First  $1 \times 2 \times 3 \times 4 \times 5 \times 6 \times 7 \times 8 = 40320$   $\left| \begin{smallmatrix} 0 \\ \text{N} \\ 0 \end{smallmatrix} \right|$  Changes

Then  $40320 \times 8 = 322560$   $\left| \begin{smallmatrix} 0 \\ \text{N} \\ 0 \end{smallmatrix} \right|$  Sec. = 89  
Hours and 36 Minutes the time the 40320 Changes  
wou'd be in ringing once over, admitting 1 Change  
to be rung in 8 Seconds.

EXAMPLE 2.

How often might a Family of 12 persons dine together, and be placed every day in a different Position?

$1 \times 2 \times 3 \times 4 \times 5 \times 6 \times 7 \times 8 \times 9 \times 10 \times 11 \times 12 =$   
479001600 Days, which (at 365 Days to the Year)  
are equal to  $1312333\frac{1}{3}$  Years the Answer.

SCHOLIUM.

I shall conclude this *Rule* with two Questions in *Combinations*, the first from *Ladies Diary*, 1711, and the second from Mr. *Birks*' Arithmetic, who gives the following

R U L E.

“ Having placed the given Quantity by itself, de-  
“ crease it gradually by an Unit, so often as there are  
“ quantities in the Combinations; placing them one  
N n 3 “ after

“ after another, with a sign of multiplication between  
 “ them, which numbers must be multiplied into one  
 “ another for a dividend : then placing an Unit  
 “ with the like number of places, increasing by Unit  
 “ ty 'till you arrive at the Number to be combin'd;  
 “ which multiply continually for a Divisor, and the  
 “ Quotient will be the Number of Combinations  
 “ sought.”

Question 1. by Mr. William Hawney.

*Ladies Diary, 1711.*

A famous Gen'ral having serv'd his King,  
 Who, always from the Wars did Vict'ry bring,  
 For this good Service (with a pleasant smile,  
 Ask'd of his King, one farthing for each file  
 Of ten Men in a file, which he cou'd then  
 Make with a Body of one hundred Men.  
 The King, confid'ring his brave Actions past,  
 And seeming Modesty of his request,  
 Gave his consent—To what will it amount  
 In Sterling Money? take your Pen and count.

$$\frac{100}{1} \times \frac{99}{2} \times \frac{98}{3} \times \frac{97}{4} \times \frac{96}{5} \times \frac{95}{6} \times \frac{94}{7} \times \frac{93}{8} \times \frac{92}{9} \times \frac{91}{10} =$$

$$\frac{62815650955529472000}{3628800} = 17310309456440$$

Farthings, which are equal to 1803<sup>£</sup>1572350<sup>s</sup> 9<sup>d</sup> 2 the  
 Answer.

Question 2. by Mr. Birks.

In *Lincolnshire*, where bounteous Nature yields  
 Fat sheep and oxen, and luxuriant fields;  
 Our gen'rous clime, replete with rosy health,  
 Choice friends afford, bright, fair, & plenteous wealth.  
 Some fenny ground have we, with flocks of geese,  
 Yielding five times a year, their feather'd fleece.

On

On which devoid of care, Swains sleeping lie,  
After repast of sav'ry giblet-pye.  
One day at *Boston* o'er a jug of ale,  
A *Gossard* offer'd all his flock to sale  
At fifteen pence a piece, but I propos'd  
A diff'rent price, with which he quickly clos'd.  
(The geese are mark'd by cutting toe or heel,  
The webs are pierc'd or slit with sharpen'd steel.)  
An hundred pounds for just as many geese,  
As may be diff'rent mark'd: What's that a piece?

As each goose had 3 toes, 2 webs and 1 heel on each foot, there were 12 different things to be mark'd, but as the 4 webs might be either slit or pinched, but not both together, therefore  $2 \times 2 \times 2 \times 2 \times 2 \times 2 \times 2 \times 2 \times 2 \times 2 \times 2 \times 2 = 256$  and  $3 \times 3 \times 3 \times 3 = 81$ .

Now  $256 \times 81 = 20736$  } the N<sup>o</sup>. of { Combinations  
 and  $20736 - 1 = 20735$  } { Marks or Geese  
*Geese. £ Goose. d*  
 Then As  $20735 : 100 :: 1 : \frac{553}{147}$  the Answer.

## SINGLE POSITION;

Or, the Single *Rule of False.*

**P**OSITION is so call'd, because  
Uncertain Numbers we suppose  
To reason with, and by them gain  
True Numbers sought—'tis very plain.

*Single Position* discovers the truth by one supposed Number, and is wrought by the following

## RULE.

**Choose your Position, then prepare  
To work as if the Number were**

# The

The true one, and perhaps you'll see  
 Th' result will not with truth agree,  
 Then this proportion there must be,  
 As th' result of your Position's to  
 The same Position taken, — so  
 The given Number 'll always be,  
 Unto the Number sought you'll see.

## EXAMPLE 1.

At a certain School if you add  $\frac{1}{2}$ ,  $\frac{1}{4}$  and  $\frac{1}{5}$  of the Number of Scholars together the sum will be 76. *Quere* the Number of Scholars?

Suppose the Number of Scholars were 100, then  $\frac{1}{2}$  and  $\frac{1}{5}$  thereof wou'd be 95 which (by the Question) shou'd have been only 76, therefore

$$\begin{array}{ccccccc} & \text{Sch.} & \text{Sch.} & & \text{Sch.} & & \text{Sch.} \\ \text{As } \left. \begin{array}{l} \text{As} \\ \text{Or As} \end{array} \right\} 95 : \left\{ \begin{array}{l} 100 \\ 76 \end{array} \right\} :: \left\{ \begin{array}{l} 76 \\ 100 \end{array} \right\} : \left\{ \begin{array}{l} 80 \\ \text{the Answer.} \end{array} \right. \end{array}$$

## EXAMPLE 2.

Near *Marbury* within a Cottage tarry,  
 Old *Simon* with his Daughters *Ruth* and *Mary*.  
 The one hath charms to captivate the mind,  
 The other's handsome, and to love inclin'd,  
 Oft, though in vain, a neighb'ring *Swain* hath try'd  
 To gain consent to have one for his bride,  
 But the mortise, old peevish Man won't give  
 Consent, as long as ever he doth live.  
 Like Nuns who're in a Nunnery confin'd,  
 He keeps his Daughters close from all mankind.  
 All lovers from his house, he makes to run,  
 With rusty Rapier, Blunderbuss, or Gun.  
 While *Simon* lives, each Daughter must obey,  
 Hard Lot ! for them, we cannot choose but say.

The

**The Father's and the Daughters Age you'll find,  
From what you see is underneath subjoin'd, \*  
Which being found, pity the maidens cause,  
Who must obey, a churlish Father's laws.**

yes.

Suppose 20 to

Suppose 20 to }  
 Then (*per* Q.)  $20 - 2 = 18$  } would be the { eldest }  
 and  $20 + 18 = 38$  } } youngest } daughter's }  
 } } Father's Age. }

The Sum whereof is 76 which (per Question) shou'd have been 124, therefore

yrs yrs yrs yrs.

As 76:38::124:62 the Father's Age, which being taken from 124 (the sum of all their Ages) leaves 62 the sum of the two Daughter's Ages, and as the one Daughter is 2 years older than the other, consequently, 32 and 30 must be their respective Ages.

### EXAMPLE 3:

A person being asked what number of Shillings he had in his pocket, reply'd if I had as many,  $\frac{1}{2}$  as many and  $\frac{1}{4}$  as many, I shou'd have 275. How many Shillings had he?

Suppose he had 60 Shillings, then as many,  $\frac{1}{2}$  as many, and  $\frac{1}{4}$  as many would make 165, which (by the Question) shou'd have been 275, therefore

As 165:60::275:100 the Answer.

\* The Father's Age is equal to the Sum of both the Daughter's Ages, the one Daughter is 2 years older than the other, and the Sum of all their Ages is 124.

**Exam-**

## EXAMPLE 4.

An old Woman of above threescore and ten,  
 Has buried four husbands, and married again  
 To *Jerry* the Mugman,—a Bagpiper Rare!  
 And none can with him for his music compare.  
 The music he play'd pleas'd the old woman much  
 'Till she hopp'd and she caper'd about without crutch,  
 Though wrinkled and wither'd—no tooth in her head  
 Yet money she had and she got married,  
 To his Bagpipes she mov'd, with one foot in the grave  
 For all her delight was a husband to have!  
 The sum of both ages one hundred years are  
 Wanting five—and one fourth of her Age I declare,  
 Is the Age of the husband—now *Tyro* you'll find,  
 The Bagpiper's Age with his Spouse's so kind.

Suppose 80 to  $\left. \begin{array}{l} \frac{1}{4} \\ \frac{1}{4} \end{array} \right\} \left\{ \begin{array}{l} \text{Wife's} \\ \text{Husband's} \end{array} \right\} \frac{1}{4}$   
 Then (per Q.) 20 wou'd  $\left. \begin{array}{l} \frac{1}{4} \\ \frac{1}{4} \end{array} \right\} \left\{ \begin{array}{l} \text{Wife's} \\ \text{Husband's} \end{array} \right\} \frac{1}{4}$

The sum whereof is 100 which (by the Question) shou'd  
 have been only 95, therefore

As 100:80::95:76 }  $\left. \begin{array}{l} \frac{1}{4} \\ \frac{1}{4} \end{array} \right\} \left\{ \begin{array}{l} \text{Wife's} \\ \text{Husband's} \end{array} \right\} \frac{1}{4}$   
 Then (per Q.)  $\frac{1}{4} 76 = 19$  }  $\left. \begin{array}{l} \frac{1}{4} \\ \frac{1}{4} \end{array} \right\} \left\{ \begin{array}{l} \text{Wife's} \\ \text{Husband's} \end{array} \right\} \frac{1}{4}$

## P R O M I S C U O U S Q U E S T I O N S.

## Question 1. by Mr. Charles Hutton.

A Gentleman distributed 78 pence among a number of poor People, consisting of Men, Women and Children, to each Man he gave 6d, to each Woman 4d, and to each Child 2d, moreover there were twice so many

many Women as Men, and thrice so many Children as Women: How many were there of each?

Suppose 6 to be the No. of Men which at 6<sup>d</sup> each, would receive 36<sup>d</sup>  
 Then (per Q.) 12 } would be the No. of Women which at 4<sup>d</sup> each, would receive 48<sup>d</sup>  
 and 36 } would be the No. of Children which at 2<sup>d</sup> each, would receive 72<sup>d</sup>

The Sum whereof is 156

but the Sum distributed was only 78<sup>d</sup>, therefore

As 156:6::78:3 } the No. of Men  
 Then (per Qu.) 3x2=6 }  
 and 6x3=18 } the No. of Women  
 and 6x3=18 } the No. of Children

*Note.* As it happens that the Result of the Position taken is 156 viz. exactly twice as much as the number of Pence distributed, therefore the half of the Supposition 6 viz. 3 must be the number of Men relieved.—The Proof of Questions belonging to this Rule being so very easy that it is unnecessary to say any thing relating thereto.

### Question 2. by Mr. Leybourn.

See his *Cursus Mathematicus*, page 52.

One delivered into the hands of a Trustee for a Child's Portion, a certain Sum of Money to be paid to the party at the expiration of 10 years with the Profit of the same Sum at £6 per Cent. Simple Int. and at the end of the 10 years the party received £450. What was the sum of money that was put into the Trustee's Hands?

Suppose the Principal or Sum delivered to the Trustee was £150, the Interest whereof for 10 years at £6 per Cent is £90, which add to £150, and the Sum or Amount will be £240, which (according to the Question) ought to have been £450; therefore

£ 150   £ 90   £ 240   £ 450  
 As 240:150::450:281 5 the Answer.   D O U.

---

---

## D O U B L E P O S I T I O N.

**T**O work this *Rule*, you'll quickly see,  
 Two suppositions there must be  
 By means of which the number's found  
 That's sought—as quickly I'll expound.

### R U L E.

Two suppositions make, and see  
 How with your Question they agree,  
 By working with them, as if they  
 Were the true numbers sought, I say—  
 How much th' *Results* are diff'rent find,  
 From *that* i'th' Question—*Tyro* mind—  
 Th' differences or errors multiply,  
 Crosswise the suppositions by.  
 Now if the errors do agree,  
 That is, if *both the Results* shall be }  
 Greater or less (as you may see) }  
 Than is th' *Result*, i'th' Question—then  
 Th' *Diff'rence* o'th' products is th' dividend,  
 Which when it is divided true }  
 By th' *Diff'rence* o'th' errors—*Tyro* you }  
 Will have an Answer in your view. }  
 But if the errors disagree }  
 That is, if th' one *Result* shall be, }  
 Too much, *th' other* too small you see, }  
 The *Sum* of the two products, then  
 Most certain, is your dividend,  
 And th' *Sum* o'th' errors then most clear, }  
 Is your divisor—so take care, }  
 For th' quote's the Answer I declare. }

### EXAMPLE I.

A merry old workman, a thrasher of corn,  
 Agreed with a Farmer, one *Anthony Horn*,

To

To thrash him his Wheat, at ten groats for a Score,  
 Two and sixpence his Barley, th' Sum was no more,  
 One hundred Bushels he thrash'd to his mind  
 And then he received the sum here subjoin'd. \*  
 How much of each sort, then be pleased to find }  
 Did he thrash, e're he call'd for a full flowing bowl, } 14s 2d  
 For like *Stephen Duck*, he's a tippling soul.

Suppose 60 to be the No. of Bush. of (Wh.) the thrash- ing of which, at }  
 Then (*per Q.*) 40 wou'd be the No. of Bush. of (Bar.) the thrash- ing of which, at }  
 3 4 }  
 2 6 }  
 per Score to }  
 120  
 60

The Sum of which is 180  
 which shou'd be only 14s 2d = 170  
 First Error 10

Again, Suppose 56 to be the No. of Bush. of (Wh.) the thrash- ing of which, at }  
 Then (*per Q.*) 44 wou'd be the No. of Bush. of (Bar.) the thrash- ing of which, at }  
 3 4 }  
 2 6 }  
 per Score to }  
 112  
 66

The Sum of which is 178  
 which shou'd be only 14s 2d = 170

Second Error 8

Whence according to the *Rule*  
 From 56 }  
 Take 60 }  
 10  
 8  
 560  
 480

60 56  
 X  
 10 8  
 (40

and the *diff.* of the Prod. is 80 which divide by 2 the  
 00 *diff.*

difference of the Errors, and the Quotient will be 40 the number of Bushels of Wheat, and consequently 60 must be the number of Bushels of Barley, as is easily prov'd

for and	the thrashing of	$\left\{ \begin{array}{c} 40 \\ 60 \end{array} \right\}$ Bushels	of	$\left\{ \begin{array}{c} \text{Wheat} \\ \text{Barley} \end{array} \right\}$	at	$\left\{ \begin{array}{cc} 3 & 4 \\ 2 & 6 \end{array} \right\}$	$\left\{ \begin{array}{c} \text{Score} \\ \text{amts. to} \end{array} \right\}$	$\left\{ \begin{array}{cc} 6 & 8 \\ 7 & 6 \end{array} \right\}$

The qty. thrash'd viz 100 Bush. wch. p. Q. amts. to 14 2

*Solution when both the Errors are in defect viz. when the Result of both Suppositions are too little.*

Suppose 26 to  $\left\{ \begin{array}{c} \text{be the} \\ \text{N}^{\circ} \text{ of} \\ \text{Bushels} \end{array} \right\}$  of  $\left\{ \begin{array}{c} \text{Wheat} \\ \text{Barley} \end{array} \right\}$

Then (*per Q.*) 74 wou'd with which proceed according to the conditions of the Question (the same as in the preceding page) and the Result will be found to be only 163, which is *too little* by 7 the first Error.

Again, Suppose 20 to  $\left\{ \begin{array}{c} \text{be the} \\ \text{N}^{\circ} \text{ of} \\ \text{Bushels} \end{array} \right\}$  of  $\left\{ \begin{array}{c} \text{Wheat} \\ \text{Barley} \end{array} \right\}$

Then (*per Qu.*) 80 wou'd with which proceed according to the Conditions of the Question and the Result will be found to be only 160 which is *too little* by 10 the second Error. Then agreeable to the Rule, the Errors being of the same kind,

From 26	$\left\{ \begin{array}{c} \text{the} \\ \text{1st} \\ \text{2d} \end{array} \right\}$	$\left\{ \begin{array}{c} \text{Suppo-} \\ \text{fition} \\ \text{multi-} \\ \text{pli'd by} \end{array} \right\}$	$\left\{ \begin{array}{c} 10 \\ 7 \end{array} \right\}$	$\left\{ \begin{array}{c} \text{the} \\ \text{2d} \\ \text{1st} \end{array} \right\}$	Error =	$\left\{ \begin{array}{c} 260 \\ 140 \end{array} \right\}$
Take 20						

and the Difference of the Products will be 120 which divide by 3 the Difference of the Errors, and the Quotient will be 40 the Number of Bushels of Wheat the same as in the preceding page.

*Solution*

*Solution with an Error of Defect and Excess viz. when the Result of one Supposition is too little and the other too great.*

Suppose 34 to } be the No. of Bushels of { Wheat  
Then (*per Qu.*) 66 wou'd } be the No. of Bushels of { Barley

The Result whereof according to the Conditions of the Question will only be 167, which ought to have been 170 and therefore is *too little* by 3 the first Error.

Again, Suppose 80 to } be the No. of Bushels of { Wheat  
Then (*per Qu.*) 20 wou'd } be the No. of Bushels of { Barley

The Result whereof according to the Conditions of the Question will be found to be 190, but shou'd only be 170, and therefore is *too much* by 20 the second Error. Then agreeable to the Rule, as the Errors are of a *different kind*,

$$\begin{array}{l} \text{To } 34 \left\{ \begin{array}{l} \text{the } \left\{ \begin{array}{l} 1 \text{ ft} \\ 2 \text{ d} \end{array} \right\} \text{ Suppo-} \\ \text{Add } 80 \left\{ \begin{array}{l} \text{the } \left\{ \begin{array}{l} 20 \\ 3 \end{array} \right\} \text{ the } \left\{ \begin{array}{l} 2 \text{ d} \\ 1 \text{ ft} \end{array} \right\} \end{array} \right. \end{array} \right. \text{ sition multi-plied by } \left. \right\} \text{ Error} = \left\{ \begin{array}{l} 680 \\ 240 \end{array} \right. \\ \hline \end{array}$$

and the *Sum* of the Products will be 920 which divide by 23 the *Sum* of the Errors, and the Quotient will be 40 the number of Bushels of Wheat, the same as before. And thus you see let the Errors happen *how they will*, the Answer may be easily obtained by paying a due regard to the Rule in page 432, and from whence is deduced this

## C O R O L L A R Y

As } the { *Diff.* } of the Errors if they are of { the same } kind  
Or As } the { *Sum* } of the Errors if they are of { a different } kind  
is to the Difference of the Suppositions, so is the least Error to the Correction of the Supposition belonging

to this Error, which must be added to or subtracted from such Supposition according to the following Conditions *viz.*

If the Errors be of the *same kind* and the Supposition belonging to the least Error

be  $\left\{ \begin{array}{l} \text{gr.} \\ \text{less} \end{array} \right\}$  than the other Supposition  $\left\{ \begin{array}{l} \text{add} \\ \text{sub.} \end{array} \right\}$  the Correction  $\left\{ \begin{array}{l} \text{to} \\ \text{fr.} \end{array} \right\}$  its Supposition, and the  $\left\{ \begin{array}{l} \text{Sum} \\ \text{Diff.} \end{array} \right\}$  will be the Answer.

But if the Errors be of a *different kind* and the Supposition belonging to the least Error

be  $\left\{ \begin{array}{l} \text{gr.} \\ \text{less} \end{array} \right\}$  than the other Supposition  $\left\{ \begin{array}{l} \text{sub.} \\ \text{add} \end{array} \right\}$  the Correction  $\left\{ \begin{array}{l} \text{fr.} \\ \text{to} \end{array} \right\}$  its Supposition, and the  $\left\{ \begin{array}{l} \text{Diff.} \\ \text{Sum} \end{array} \right\}$  will be the Answer.

In the *first Solution* of the preceding Question in page 433,

the  $\left\{ \begin{array}{l} 1\text{st} \\ 2\text{d} \end{array} \right\}$  Supposition is  $\left\{ \begin{array}{l} 60 \\ 56 \end{array} \right\}$  and its Error  $\left\{ \begin{array}{l} 10 \\ 8 \end{array} \right\}$  in Excess.

Now the Errors being of the *same kind* or *affection* therefore (according to the beforementioned *Corollary*) the *Analogy* will be As 2 the *Difference* of the Errors (because they are of the *same kind*) is to 4 the *Difference* of the Suppositions, so is 8 the *least Error*, to 16 the *Correction* of the Supposition belonging to this Error, which *subtract* from its Supposition 56 (because the Errors are of the *same kind*, and the Supposition belonging to the least Error is *less* than the other Supposition, see the *Corollary*) and the *Remainder* will be 40 the Number of Bushels of Wheat the same as in the preceding *page*.—The Proof of the other two *Solutions* by the abovementioned *Corollary* is so easy that it is needless to insert it.

EXAM-

EXAMPLE 2.

Three persons *A*, *B* and *C* spent a certain Sum at an Alehouse, and at paying the Reckoning; *A* threw down a Crown and one fifth of the whole, *B* threw down one fourth of the whole, and *C* paid the rest, being three tenths of the whole. What was the Reckoning, and what did each pay?

Suppose the Sum spent was 8*s*, then (*per* Question)  $5 + 1.6 + 2 + 2.4 = 11$  which ought to have been but 8 therefore  $11 - 8 = 3$  is the first Error.

Again, Suppose the Sum spent was 15*s*, then (*per* Question)  $5 + 3 + 3.75 + 4.5 = 16.25$  which ought to have been but 15, therefore  $16.25 - 15 = 1.25$  is the other Error.

Now as the Errors are of the *same kind*, therefore according to the *Rule* in page 432.

$$\begin{array}{l} \text{From } 15 \\ \text{Take } 8 \end{array} \} \times \left\{ \begin{array}{l} 3 \\ 1.25 \end{array} \right\} = \left\{ \begin{array}{l} 45 \\ 10 \end{array} \right.$$

$$\begin{array}{r} 8 \qquad 15 \\ \text{X} \qquad (20 \\ \hline 3 \qquad 1.25 \end{array}$$

and the *Diff.* of the Prod. will be 35 which divide by 1.75 the *Difference* of the Errors, and the Quotient will be 20 the Number of Shillings spent, whereof *A* paid a Crown and  $\frac{1}{5} = 9*s*$ , *B* paid  $\frac{1}{4} = 5*s*$  and *C* paid the rest *viz.*  $\frac{3}{10} = 6*s*$ , which several shares added together make 20*s* the whole Reckoning, the same as above.

*Note.* The above Question I propos'd in *Palladium* 1767, and which was answer'd nearly in the above manner by Master *John Flint*, an ingenious pupil of Mr. *Nathaniel Brownell's* of *Coventry*, under whose *Solution* is a general Rule (the same in substance or

meaning, as that which I have given in verse in *page 432*) and the following lines.

“ Errors *unlike*, Addition use,  
“ But when *alike*, Subtraction choose.”

*Solution of the Question by the Corollary in page 435.*

As 1.75 the *Difference* of the Errors (because they are of the *same kind*) is to 7 the *Difference* of the Suppositions, so is 1.25 the least Error, to 5 the Correction of the Supposition belonging to *this Error*, and now as the Errors are of the *same kind*, and the Supposition belonging to the least Error is *greater* than the other Supposition, therefore (pursuant to the directions of the abovementioned *Corollary*) *add*, the Correction 5, to its Supposition 15, and the *Sum* will be 20 the Number of Shillings spent, the same as in the preceding *page*.

But this Question may be very easily solved (and indeed so may many curious things) by *Vulgar Fractions* only, for the Shares or Fractions in this Question *viz.*  $\frac{5}{7}$ ,  $\frac{3}{4}$  and  $\frac{3}{8}$  (reduced to a Common Denominator by the *Note to Case 9 page 251* and) added together make  $\frac{15}{8} = \frac{3}{4}$  which being all the Reckoning except the 5s that *A* paid over and above the  $\frac{5}{7}$ , it is therefore very plain that 5s must be  $\frac{1}{4}$  of the Reckoning and consequently  $5 \times 4 = 20$  Shillings the whole of it, the same as before.

### EXAMPLE 3.

*Inscrib'd to the Ladies.*

Hail, lovely *Nymphs*! while I this tale impart,  
Cupid, a Swain hath wounded to the heart,  
'Tis an inconstant *Fair*, his suit denies,  
His humble suit, nay all his art defies.

His

His name fair Ladies if you chuse to know,  
It may be found from what appears below, \*  
Which being known, pity the slighted Swain,  
Who's fetter'd strong in love's tormenting chain.

Suppose the first letter's place to be 2, then (*per Qu.*)  
 $2 + 2 \times 3 + 2 + 2 = 12$  but ought to be 22, therefore  
 $22 - 12 = 10$  is the first Error and is in *Defect*.

Again, Suppose the first Letter's place to be 6,  
then (*per Qu.*)  $6 + 6 \times 3 + 2 + 6 = 32$  which ought to  
have been but 22, therefore  $32 - 22 = 10$  is the second  
Error but is in *Excess*. Now as the Errors are of  
*different kinds or affections*, therefore according to  
the Rule in page 432,

To  $2 \times 10 = 20$

Add  $6 \times 10 = 60$

and the Sum of —

the Prods. will be } 80 which divide by 20 the Sum of  
the Errors, and the Quotient will be 4 the first Letter's  
place.—But here it may be observed, that when the  
Errors happen to be *unlike* in *Quantity* but *unlike* in  
*Quality* (as in this *Solution*) the Answer may be more  
easily obtained than by proceeding as above, for in  
such Case, half the Sum of the Suppositions will be  
the Number sought as in this *Solution*; the Sum of the  
Suppositions 2 and 6 is 8, half whereof is 4 the first  
Letter's place, the same as above.

2      6  
X  
(4  
10      10

---

\* This person's Name consists of three Letters, the  
first and third are the same, the second Letter's place  
in the Alphabet is 3 times *that* of the first or third  
more 2, and the Sum of the places of all the 3 Let-  
ters is 22. And

And here I wou'd just observe that it is *oftentimes* (if not always) of great advantage (by saving a deal of work in most Solutions) to make a *Cypher* and an *Unit* the two Suppositions, as in the preceding Question, Suppose the first Letter's place to be 0, then (per Qu.)  $0 + 0 \times 3 + 2 + 0 = 2$  which ought to have been 22, therefore  $22 - 2 = 20$  is the first Error, and is in *Defect*.

Again, Suppose the first Letter's place to be 1, then (per Qu.)  $1 + 1 \times 3 + 2 + 1 = 7$  which ought to have been 22, therefore  $22 - 7 = 15$  is the other Error, and is also in *Defect*. Now the Errors being of the *same kind* therefore according to the *Rule* in page 432,

From  $1 \times 20 = 20$

Take  $0 \times 15 = 0$

$\begin{array}{cc} 0 & 1 \\ & \text{X} \\ & \end{array} \quad (4)$

and the *Diff.* of the Prod. will still be 20 which divide by 5 the *Difference* of the Errors, and the Quotient will be 4 the first Letter's place, the same as above.

Now the first Letter's place being 4 }  
 the 2d (by the Qu.) must be  $4 \times 3 + 2 = 14$  } = { *D*  
 and the 3d, or last, the same as the 1st viz. 4 } { *O*  
 whence *D O D* is the person's Name.

*To the inconstant Celia.*

When pretty Maids inconstant prove,  
 The youthful Swains must die for love,  
 O! gentle Fair! to *D O D* be kind,  
 And ease his wild distracted mind.

#### EXAMPLE 4.

Old Simon's dead, and Margery is found  
 A bucksome Widow with a thousand Pound,

'Cause

'Cause she hath *Gold*, many a courting go,  
Both *Old* and *Young*, the *Clown* and *fribbling Beau*, }  
She treats them kindly, *Ladies* you must know. }  
Her Age and Number of Sweethearts you'll find,  
From what you see is underneath subjoin'd. \*

Suppose 0 for the Number of Sweethearts, then  
(*per Qu.*)  $0 \times 6 + 10 = 10$ , one fourth of which is 2.5  
which add to 0 and the Sum will still be 2.5 which  
ought to have been 65, therefore  $65 - 2.5 = 62.5$  is  
the first Error, and in *Defect*.

Again, Suppose the Number of Sweethearts to be 1  
then (*per Qu.*)  $1 \times 6 + 10 = 16$ , one fourth whereof is  
4 which add to 1 and the Sum will be 5 which should  
have been 65, therefore  $65 - 5 = 60$  is the other Er-  
ror, and in *Defect* also. Now the Errors being both  
of the *same kind*, therefore according to the *Rule*  
in *page 432*,

From  $1 \times 62.5 = 62.5$

Take  $0 \times 60 = 0$

and the *Diff.* of the }  
Prods. will still be } 62.5 which divide by 2.5 the  
*Difference* of the Errors, and the Quotient will be 25  
the Number of Sweethearts.

$\begin{array}{cc} 0 & 1 \\ \text{X} & \end{array}$

(25)

62.5      60

Or according to the *Corollary* in *page 435*. As 2.5  
the *Difference* of the Errors (because they are of the  
*same kind*) is to 1 the *Difference* of the Suppositions,  
so is 60 the least Error, to 24 the Correction of the

---

\* Six times the Number of Sweethearts more ten  
is just four times the Widow's Age, and the Sum of  
both is 65.

Supposition

Supposition belonging to this Error, which Supposition being *greater* than the other, and the Errors of the *same kind*, therefore (pursuant to the beforementioned Corollary) add 24 the Correction, to its Supposition 1, and the Sum will be 25 the Number of Sweethearts, as before, and consequently

$$\frac{25 \times 6 + 10}{4}$$

$\frac{25 \times 6 + 10}{4} = 40$  must be the Widow's Age.

4

In Answer to this Question the undermentioned *Gentlemen* have written in the *Ladies Diary* for 1765 as under.

Mr. Malachy Hitchens.

Margery's Age is forty Years,  
Her Sweethearts five and twenty ;  
How plainly *Avarice* appears,  
In bringing her such plenty :  
Had she *ten thousand Charms* in store,  
But wanted *One, in Money*,  
I dare affirm, of all the score,  
Scarce *One* wou'd be so funny.

Mr. Isaac Tarrat of Epsom.

A bucksome Widow sure ! of wond'rous Parts,  
Thus to attract, or wound so many Hearts ;  
Widow ! set up a School, instruct old Maids,  
If this thou canst, 'twill be the best of Trades.

### EXAMPLE 5.

At *Marbury* lately a Wedding has been,  
One similar to it, yet never was seen,  
At Church when the Bridegroom & Bride did appear,  
Crowds burst out with laughter—that rumour led there.

To

To see this fine couple excited them much,  
 The Bridegroom deform'd,—with club feet & a crutch!  
 Came hopping along, and his Bride in full view  
 A bucksome young Lads, of a delicate hue!  
 While linking,—the Parson his Clark then did call,  
 To hold up the Bridegroom, for fear he shou'd fall.  
 The rites being over,—he halted away,  
 The bells they did ring, and the village was gay,  
 The Name of the Bridegroom may quickly be told,  
 If what you see under \* vouchsafe to unfold.

✶ The Name is composed of 5 Letters, as under.

the  $\left\{ \begin{array}{l} 2d \\ 4th \\ 3d \\ 5th \end{array} \right\}$  Letters' place in the Alphabet is  $\left\{ \begin{array}{l} \frac{1}{4} \\ \frac{1}{7} \end{array} \right\}$  of the 1st Letters' place  
 $\left\{ \begin{array}{l} 4th \\ 2d \end{array} \right\}$  Sum of the  $\left\{ \begin{array}{l} 4th \\ 2d \end{array} \right\}$  and  $\left\{ \begin{array}{l} 5th \\ 4th \end{array} \right\}$  Letters' places  
 and the Sum of all the 5 Letters places is 48.

Suppose the first Letter's place to be 7 then (*per Q.*)  
 $7 + 1.5 + 3.5 + 1 + 2.5 = 15.5$  but ought to be 48,  
 therefore  $48 - 15.5 = 32.5$  the first Error, and is in  
*Defect*.

Again, Suppose the first Letter's place to be 14  
 then (*per Qu.*)  $14 + 3.25 + 7.25 + 2 + 5.25 = 31.75$  but  
 ought to be 48, therefore  $48 - 31.75 = 16.25$  is the o-  
 ther Error, and is also in *Defect*. Whence accord-  
 ing to the *Rule* in page 432,

From 14  $\times \left\{ \begin{array}{l} 32.5 \\ 16.25 \end{array} \right\} = \left\{ \begin{array}{l} 455 \\ 113.75 \end{array} \right\}$

Take 7  $\times \left\{ \begin{array}{l} 32.5 \\ 16.25 \end{array} \right\} = \left\{ \begin{array}{l} 455 \\ 113.75 \end{array} \right\}$

and the *Difference* of  $\left\{ \begin{array}{l} 455 \\ 113.75 \end{array} \right\}$  —  $\left\{ \begin{array}{l} 455 \\ 113.75 \end{array} \right\}$   
 the Products will be } 341.25 which divide by 16.25,  
 the *Difference* of the Errors, and the Quotient will be  
 21 the place of the first Letter.

7 14  
 X (21)

Now

$$\begin{array}{l}
 \text{Now as the 1st Letters' place is } 21 \\
 \text{the } \left\{ \begin{array}{l} 2^{\text{d}} \\ 3^{\text{d}} \\ 4^{\text{th}} \\ \text{and the } 5^{\text{th}} \end{array} \right\} \text{ Letter's place must be } \left\{ \begin{array}{l} \frac{1}{4} \text{ of } 21 - 1 \\ 8 + 3 \\ \frac{1}{7} \text{ of } 21 \\ 5 + 3 \end{array} \right\} = \left\{ \begin{array}{l} 5 \\ 11 \\ 3 \\ 8 \end{array} \right\} \text{ viz. } \left\{ \begin{array}{l} W \\ E \\ L \\ C \\ H \end{array} \right.
 \end{array}$$

The Sum of all the Letters places is 48 which shew the Bridegroom's Name to be *WELCH*.

And here I would observe to the Learner, that the *Rule of Position* will not bring out true Answers when the Numbers sought ascend above the first Power, for in that case (as Mr. *Hutton* justly remarks in his *Arithmetic*, page 140) the Results are not proportional with their Positions, nor the Errors with the difference of the true Number and each Position, yet in all such cases (as that *Gentleman* adds) it is a very good Approximation, and in exponential Equations, as well as many other things, succeeds better than perhaps any other method. And as the *Rule of Position* is so very useful in solving many intricate Problems, not only in *Arithmetic*, but also in *Algebra* and most parts of the *Mathematics*, therefore in order to obviate any difficulty that can possibly occur in this excellent *Rule of Position*, I shall give a Question or two wherein the Method of Approximation will be shewn, and also that sometimes Questions of that kind, viz. such as cannot be solved by the *general Rule* in *Double Position*, may be transformed into others, resolvable thereby, or by some of the more easy *Rules* of *Arithmetic*.

EXAM-

### EXAMPLE 6.

How old must a person be that if 22 be added to his Age, the Square Root of the Sum may be 8?

Suppose the Age to be 14 then (per Q.)  $14 + 22 = 36$ , the Square Root whereof is 6, which shou'd have been 8, therefore  $8 - 6 = 2$  is the first Error and is in *Defect*.

Again, Suppose the Age to be 59 then (*per Qu.*)  $59 + 22 = 81$ , the Square Root whereof is 9, which shou'd have been but 8, therefore  $9 - 8 = 1$  is the other Error but is in *Excess*. Now as the Errors are of *different kinds* therefore agreeable to the *Rule* in *page 432.*

To  $4 \times 1 = 14$

Add 59 x 2 = 118

and the Sum of } —

the Prods. will be } 132 which divide by 3 the Sum  
of the Errors, and the Quotient will be 44, which  
will not (for the Reason given in *page 444*) answer  
the Conditions of the Question, for upon trial (ac-  
cording thereto) will be found to have an Error of  
.12 in *Excess*. Now in order to approach nearer to  
the Answer, proceed with this Error and the Number  
that produc'd it, along with either of the preceding  
Suppositions suppose the first and its Error, accord-  
ing to the *Rule* in *page 432*, viz. as the Errors are  
of a *different kind*, therefore

44                      14

$$\left. \begin{array}{l} \text{To } 44 \\ \text{Add } 14 \end{array} \right\} \times \left\{ \begin{array}{l} 2 \\ .12 \end{array} \right\} = \left\{ \begin{array}{l} 88 \\ 1.68 \end{array} \right\}$$

Add 14 } { .12 } { 1.68

and the Sum of the

Products will be 89.68 which divide by 2.12  
the *Sum* of the Errors, and the Quotient will be 42.3  
P P - which

P P

which

14 59  
X (44  
2 1

X (44)

2 1

44 I4  
X (42:3

**X** (42:3)

**.12                      2**

which also will not (for the Reason given in *page 444*) answer the Conditions of the Question, but will be *very near* doing so, for upon trial it will be found to produce so small an Error as .0187 which being so small in *Excess* makes it plain that the Number 42.3 is but a little too much, and therefore without proceeding any further, there is great reason to believe that 42 is the Number sought, but in order to become more certain thereof without trying it by the Question, and to shew the learner that the further we proceed the nearer we shall get to the Answer, let us proceed with the Error .0187 and the Number that produc'd it, along with the preceding Number found *viz.* 44 and its Error, according to the *Rule* in *page 432 viz.* the Errors being of the *same kind*, therefore

	42.3	44	
From $42.3 \times .12 = 5.076$	X		(42 nearly
Take $44 \times .0187 = .8228$			

and the *Diff.* of }  $\frac{\quad}{\quad} \frac{.0187}{.12}$   
 the Prods. will be } 4.2532 which divide by .1013  
 the *Difference* of the Errors, and the Quotient will be *nearly* 42 and which will answer the Conditions of the Question, consequently 42 is the Age required.

But here it may not be amiss to observe that in these kind of Questions where the Number sought ascends above the first Power it is best to use those Suppositions that are the *least erroneous*, for if instead of the Supposition 14 in the second Operation, the Supposition 59 had been used it having the least Error of those two Suppositions, consequently it is nearer the Number sought, and therefore by working with it (along with the Supposition 44) the Answer will be sooner approximated than as above, as appears by the following Operation.

From

$$\begin{array}{l} \text{From 44} \\ \text{Take 59} \end{array} \left. \vphantom{\begin{array}{l} \text{From 44} \\ \text{Take 59} \end{array}} \right\} \times \left\{ \begin{array}{l} 1 \\ .12 \end{array} \right\} = \left\{ \begin{array}{l} 44 \\ 7.08 \end{array} \right. \quad \begin{array}{c} 44 \quad 59 \\ \text{X} \end{array} \quad \begin{array}{l} (42 \text{ nearly} \\ \text{and the Diff. of } \frac{1}{.12} \end{array}$$

the Prods. will be  $\left\{ \begin{array}{l} 36.92 \end{array} \right\}$  which divide by .88 the *Difference* of the Errors, and the Quotient will be *nearly* 42 the Answer, the same as before.

But this Question may be far more easily solv'd than by the preceding method of Approximation, for it is plain before the Square Root is extracted (see the Question *page* 445) the Sum must be equal to the Square of 8 *viz.* 64. Whence the Question is easily transformed to this *viz.* What Number is that, to which if 22 be added the Sum may be 64?—The Answer to this Question and consequently to that in *page* 445 (the Answer to the one being the Answer to the other) will by the *Rule* in *page* 432, or by the *Corollary* in *page* 435, be easily found to be 42 the same as above.

But the Question being transform'd as above is become so simple and easy, that it may be solv'd by *Subtraction* only, for from 64 take 22 and the Remainder will be 42 the Answer, the same as before.

### EXAMPLE 7.

What Number is that which multiplied by  $\frac{1}{5}$  of itself, the Product may be 81?

It is plain from what is said in *page* 444 and from the nature of the Question that an *exact* Answer thereto cannot be obtained by the *Rule of Position*, but that (after the manner of the preceding Question) it may be approximated to any desired degree of exactness, but the Answer may be more easily found out

by transforming the Question, for it is manifest that  $\frac{1}{9}$  of the Square of the Number sought must be 81, therefore the Number sought must be the Square Root of the Answer to the following Question *viz.* What Number is that which being divided by 9 the Quotient may be 81? the Answer thereto will by *Single Position* be easily found to be 729; or by *Multiplication* only, for  $81 \times 9 = 729$  which is the Square of the Number sought, and consequently the Square Root of 729 *viz.* 27 must be the Number sought or required.

## EXAMPLE 8.

Young *Hodge* a homely Country Swain,  
 Long courted *Susan* of the Plain,  
 But never cou'd a method find,  
 To bring the Fair-One to be kind.  
 Her pride is center'd in herself,  
 She calls him Clown and Country Elf,  
 And mimicks fashion with an air,  
 For dressing few with her compare.  
 This Charmer's Name with ease you'll find,  
 From what is underneath subjoin'd. \*  
 O! tell the way to make her kind.

\* This Maiden's Name is composed of 3 Letters, as under.

the  $\left\{ \begin{array}{l} 2^{\text{d}} \\ 3^{\text{d}} \end{array} \right\}$  Letter's place in the Alphabet is the  $\left\{ \begin{array}{l} \text{Sum of} \\ \text{the} \\ \text{Squares} \\ \text{of the 1st} \\ \text{and 3d} \\ \text{Letters' Places} \\ \text{more} \end{array} \right\}$  1st Letter's Place less

and the Sum of all the 3 Letters' Places is 19.

Suppose 4 to }  
 Then (*per Q.*)  $4 + 4 - 1 + 1 = 26$  } would be the  $\left\{ \begin{array}{l} 1^{\text{st}} \\ 2^{\text{d}} \\ 3^{\text{d}} \end{array} \right\}$  Letter's Place.  
 and  $4 - 1 = 3$

The Sum whereof is 33 which should have been but 19, therefore  $33 - 19 = 14$  is the first Error, and in *Excess*. Again.

Again, Suppose 6 to } be the { 1st } Letters  
 Then (per Q.)  $6 + 6 - 1 + 1 = 62$  } be the { 2d } Letters  
 and  $6 - 1 = 5$  } be the { 3d } Place.

The Sum wherof is 73 which shoud have been only 19, therefore  $73 - 19 = 54$  is the other Error, and is also in Excess. Now as the Errors are of the same kind, therefore according to the Rule in page 432.

4                  6  
 (3-3  
 34                  54

From 4 }  
 Take 6 }  $\times \begin{Bmatrix} 54 \\ 14 \end{Bmatrix} = \begin{Bmatrix} 216 \\ 84 \end{Bmatrix}$   
 and the Diff. of }  $\frac{216 - 84}{14 - 4} = 132$

the Prods. will be } 132 which divide by 40 the Difference of the Errors, and the Quotient will be 3.3

Now as the Places of the Letters in the Alphabet cannot but be whole Numbers, therefore the above-mentioned Quotient 3.3 ought to have been a whole number only, wherefore it seems very likely that the first Letter's place of the name sought, must be either 3 or 4, and upon trial 3 will be found to Answer the conditions of the Question, for the first Letter's place being 3, the second Letter's place (by the Question) will be  $3 + 3 - 1 + 1 = 14$  and the third Letter's place will be  $3 - 1 = 2$ , the sum of which three places is 19 agreeing with the Question. And now

the { 1st } Letter's place being found to be { 3 } therefore that Letter must be { C  
 { 2d } { 14 } { O  
 and the 3d } { 2 } { B

Whence *SUSAN COB* is the Maiden's Name.

Note. This Question I propos'd in the *Ladies Diary* for 1771 with *Algebraical Equations*, which was answered

swered by Mr. *Henry Clark*, under whose Solution Mr. *Thomas Adcock* writes in advice to *Roger*, thus,

Friend *Hodge* forbear to sigh or sob  
For such a one as *SUSAN COB*,  
Address some other charming she,  
That is more complaisant and free.  
This method take ; perhaps you'll find  
The *haughty Fair* will grow more kind.

### SCHOLIUM.

The greatest part of these Questions or Examples in *Single* and *Double Position* I published with *high Algebraical Equations* or *Fluxionary Expressions*, in the *Magazines* and *annual Publications*, (but in order to confine 'em to these *Rules of Position*, I have been obliged to make some alterations therein) and as they are most of 'em in verse, I hope they will be thought an agreeable amusement, as well as a proper exercise for my ingenious readers of both sexes, and had not this Treatise been run to such a great length, I wou'd have given a great many more of these delightful Questions, but must omit 'em in order to make room for the following Promiscuous Questions, and to shew the method of finding the *least Common Multiple* of any proposed Numbers (a thing so very curious as well as useful) and also for a *copious Collection* of *new Questions* to exercise all the Rules in this Treatise, and for a few *Arithmetical Paradoxes* for the amusement and exercise of youth.

### PROMISCUOUS QUESTIONS.

Question 1. by Miss *Ann Nicholls*.

*Ladies Diary* 1761.

Old *John* who had in credit liv'd,  
Tho' now *reduc'd*, a *Sum* receiv'd :  
This lucky *Hit's* no sooner found,  
Than clam'rous *Duns* come swarming round :

To

To th' Landlord,—Baker,—many more,  
 John paid in all, Pounds ninety-four.  
 Half what remain'd—a friend he lent—  
 On Joan and Self, one fifth he spent;  
 And when of all these Sums bereft,  
 One tenth o'th Sum receiv'd had left,  
 —Now shew your skill ye learned Fair,  
 And to the world that Sum declare.

Suppose the Sum receiv'd £98 then (*per Question*)  
 $94 + 2 + .8 = 96.8$ , and  $98 - 96.8 = 1.2$  which according  
 to the Supposition ought to have been  $\frac{1}{10}$  of 98 *viz.*  
 9.8 therefore  $9.8 - 1.2 = 8.6$  is the first Error, and is  
 in *Defect*.

Again, Suppose the Sum receiv'd was £150 then  
 (*per Qu.*)  $94 + 28 + 11.2 = 133.2$ , and  $150 - 133.2 =$   
 16.8 which according to the Supposition ought to  
 have been but  $\frac{1}{10}$  of 150 *viz.* 15, therefore  $16.8 - 15$   
 = 1.8 is the other Error, but is in *Excess*. Now the  
 Errors being of *different kinds or affections*, therefore  
 according to the *Rule* in page 432,

98      150

**X**

(141

$$\begin{array}{l} \text{To } 98 \} \\ \text{Add } 150 \} \end{array} \times \begin{array}{l} \{ 1.8 \\ \{ 8.6 \end{array} = \begin{array}{l} \{ 176.4 \\ \{ 1290 \end{array}$$

and the Sum of }  $\frac{8.6}{10.4}$  } 8.6      1.8  
 the Prods. will be } 1466.4 which divide by  
 10.4 the Sum of the Errors, and the Quotient will  
 be £141 the Answer.

Or, according to the *Corollary* in page 435, As 10.4  
 the Sum of the Errors (because they are of a *different*  
*kind*) is to 52 the Difference of the Suppositions, so is  
 1.8 the least Error, to 9 the Correction of the Sup-  
 position 150, which *subtract* therefrom (because the  
 Errors

Errors are of a *different kind*, and the Supposition belonging to the least Error is *greater* than the other Supposition, see the beforementioned *Corollary*) and the *Remainder* will be £141 the Answer, the same as before.

Question 2. by Miss Padmore.

From *Palladium* for 1762.

How *Bride* and *Bridegroom's* Ages disagree,  
The following *Case* resolv'd will let you see.  
Nine times the *Husband's* Age, as late appear'd,  
Was equal to the *Lady's* Age when squar'd.  
Take twice *her* Age from *his*, and you will find,  
That just sixteen will then remain behind.

Suppose 81 to  $\left. \begin{array}{l} \text{the } \{ \text{Husband's} \\ \text{Age} \} \\ \text{the } \{ \text{Wife's} \\ \text{Age} \} \end{array} \right\}$   
Then (per Qu.)  $\sqrt{81 \times 9} = 27$  wou'd  
and  $81 - 27 \times 2 = 27$  which (by the Question)  
shou'd have been only 16, therefore  $27 - 16 = 11$  is  
the first Error, and is in *Excess*.

Again, Suppose 100 to  $\left. \begin{array}{l} \text{the } \{ \text{Husband's} \\ \text{Age} \} \\ \text{the } \{ \text{Wife's} \\ \text{Age} \} \end{array} \right\}$   
Then (per Q.)  $\sqrt{100 \times 9} = 30$  wou'd  
and  $100 - 30 \times 2 = 40$  which (by the Quest.)  
shou'd have been only 16, therefore  $40 - 16 = 24$  is  
the other Error, which is also in *Excess*. Now the  
Errors being of the *same kind*, therefore according to  
the *Rule* in page 432,

From 81 }  $\times \left\{ \begin{array}{c} 24 \\ 11 \end{array} \right\} = \left\{ \begin{array}{c} 1944 \\ 881 \end{array} \right\}$   
Take 100 }  
and the *Difference* of }  $\frac{11}{24}$   
the *Products* will be } 844 which divide by 12,  
the *Difference* of the *Errors*, and the *Quotient* will  
be

X (64.92

be 64.92, which will not (for the Reason given in *page 444*) answer the Conditions of the Question, but upon trial (according thereto) will be found to have an Error of .58 in *Excess*, which being so small gives great reason to believe that 64 must be the Number sought, but in order to be more certain thereof, without trying it by the Question, let us proceed with the Error .58 and the Number that produc'd it, along with the preceding Supposition 81 and its Error, according to the *Rule* in *page 432*, viz. as the Errors are of the *same kind*, therefore:

$$\begin{array}{rcl} \text{From } 64.92 & \times & \left\{ \begin{array}{l} 11 \\ .58 \end{array} \right\} = \left\{ \begin{array}{l} 714.12 \\ 46.98 \end{array} \right\} \\ \text{Take } 81 & & \\ \text{and the Diff. of } & & \frac{.58}{11} \end{array}$$

**X**

(64.02

the Prods. will be 667.14 which divide by 10.42 the *Difference* of the Errors, and the Quotient will be 64.02, which likewise will not (for the Reason given in *page 444*) answer the Conditions of the Question, but as the other Number found, viz. 64.92 produc'd so small an Error as .58, and since it is plain that the further we proceed the nearer we approach to the Answer, consequently the Number last found viz. 64.02 must be *very near* the Number sought, wherefore it is very likely that 64 is the *Husband's Age*, and which upon trial will be found to be so, for 64 being

account ed the  $\left\{ \begin{array}{l} \text{Husb's} \\ \text{Wife's} \end{array} \right\}$  Ages

Then (p. Qu.)  $\sqrt{64 \times 9} = 24$  must be and which two Numbers answering the Conditions of the Question prove the respective Ages as above.

*Note.* Under several *Algebraical Solutions* to this Question (by Mr. Pinnington, Mr. Antrebus, and Mr. Johnson, in *Palladium 1763*.) Mr. John Budale humourously writes thus:

“ What can old *Frosty* do with such a Wife?  
“ Youth tied to Age, palls all the Joys of Life.”

---

---

To find least COMMON MULTIPLES, &c.

SCHOLIUM.

**H**AVING now treated very copiously on the *Rules of Position*, and as in those *Rules* it is often very necessary (in order to avoid Fractions) to suppose such Number or Numbers as being divided by given Divisors shall leave no Remainder, therefore, and in order to shew how to solve many curious and pleasant Questions, which are not reducible to any of the preceding *Rules*, and consequently to make this Treatise as complete as possible, I shall now shew how to find the *Least Common Multiple* of any proposed Numbers, *i. e.* to find the least Number which may be divided by any Number of given Divisors, without leaving any Remainder, and to do which observe the following

R U L E.

All equal Numbers—as you'll see,—  
 Except one may rejected be,  
 Such as are al'quot parts I say  
 Of any o'th' others, likewise may  
 Rejected be—and when you find  
 That any proposed Number—mind—  
 Is an al'quot part o'th' *Product*, see  
 Of any o'th' Numbers, two or three, }  
 It likewise may rejected be.—  
 The Common Multiple \* of two  
 Of any o'th' given Numbers, you

---

\* Common Multiple is the Common Product of any two or more proposed Numbers, and consequently may be measured, *i. e.* divided by any of the Numbers of which it is composed without leaving any Remainder, and the Quotient will be the Product of all the other Numbers. . . . . Must

## To find least Common Multiples, &c. 455

Must true divide by what you see,  
 Their greatest Common Measure'll be,  
 The Quote's the *least Common Multiple*.  
 If any Number not us'd, is  
 An al'quot part—before mind this—  
 Of the *least Common Multiple*  
 Last found,—such may rejected be.  
 —The *least Common Multiple* find  
 Of that before found, Tyro mind—  
 And any o'th' given Numbers, too  
 Not us'd.—In the same way pursue  
 With each new *least Common Multiple*  
 'Till all the proposed Numbers be  
 Consider'd, and the *last* you'll find,  
 Will be the *Least* just to your mind.

*Note.* It is plain from the *Rule* that when Numbers are *prime* to each other, viz. When they have no other Common Measure than Unity, i. e. when no Number but Unity will measure both, their *Common Multiple* or *Product* is their *least Common Multiple*. —A *Prime Number* is such as can be measured only by Unity and a Number equal to itself, and consequently cannot be produced by the Multiplication of any Number of Integers.

### EXAMPLE I.

*Quere*, the least whole Numbers that can be divided by the 9 Digits severally, and leave no Remainder? Or which is the same thing, What is their least Common Multiple?

The given Divisors being 1, 2, 3, 4, 5, 6, 7, 8 and 9 it is plain that  $1 \times 2 \times 3 \times 4 \times 5 \times 6 \times 7 \times 8 \times 9 = 362880$  is the Common Multiple and may be divided by the 9 Digits and leave no Remainder, but in order to obtain the *least Common Multiple* or Number that will do so, the Numbers 1, 2, 3 and 4 may (according to the *Rule*) be rejected, they being aliquot parts of some  
 of

## 456 To find least Common Multiples, &c.

of the others, and as 5, 6 and 7 are *prime* to one another, therefore  $5 \times 6 \times 7 = 210$  is the *least Common Multiple* of those 3 Numbers, then multiply 210 by 8 and divide the Product or Common Multiple 1680 by 2 the greatest Common Measure of 210 and 8, and the Quotient will be 840 the *least Common Multiple* of those 2 Numbers, and lastly multiply 840 by 9 and divide 7560 the Product or Common Multiple by 3 the greatest Common Measure of 840 and 9, and the Quotient will be 2520 the *least Common Multiple* or Number required.

### EXAMPLE 2.

What is the least Common Multiple of 45, 21, 85, 7, 35 and 23 ?

Multiply 45 by 21 and divide their Common Multiple or Product 945 by 3 their greatest Common Measure, and the Quotient will be 315, which multiply by 85 and divide the Common Multiple or Product 26775 by 5 the greatest Common Measure of 315 and 85, and the Quotient will be 5355, and as 7 (the next proposed Number) is an aliquot part of 21 (one of the preceding ones) and also 35 (the next proposed Number) an aliquot part of 5355, therefore (according to the *Rule*) those 2 Numbers 7 and 35 may be rejected, then 5355 and the remaining proposed Number 23 being *prime* to each other, therefore  $5355 \times 23 = 123165$  is the *least Common Multiple* or Number required.

And here it may not be improper just to mention, that there are other methods of finding the *least Common Multiple*; but as that which I have here given is so plain and easy, and this Book far above the size it was first intended to be, I shall therefore say nothing about 'em, but only just observe that oftentimes  
a good

*To find least Common Multiples, &c. . 457*

good deal of trouble may be saved, if instead of dividing the Common Multiple or Product of the two Numbers by their greatest Common Measure, you divide the least of the two Numbers by such Common Measure, and multiply the other Number by the Quotient, but this being so plain and easy that it wou'd be quite needless to say any thing more about it.

**EXAMPLE 3.**

*Tom* the Gardener counting some Apples into a Basket, found that when he counted them in by two at a time, three at a time, and four at a time, there remained one, but when he counted 'em in by five at a time there remained none. *Quere* the Number of Apples?

The *least Common Multiple* of the Numbers 2, 3, and 4 is easily found to be 12, to which add 1 and the Sum will be 13, which divided by three of the given Numbers, *viz.* 2, 3 and 4, will leave 1 according to the Question, but divided by 5 will leave 3, which being 2 short of 5, therefore to twice 12 add 1 and the Sum will be 25, the Number required.

**EXAMPLE 4.**

Required the least Number which being divided by 7, 6, 5, 4, 3 and 2, shall leave 6, 5, 4, 3, 2 and 1 respectively?

The *least Common Multiple* of the given Divisors 7, 6, 5, 4, 3 and 2 will be easily found (by the *Rule*) to be 420, and which is the least Number that can be divided by the given Divisors without leaving any Remainder, therefore from 420 deduct 1 and the Remainder will be 419 the Answer.

## 458      *To find least Common Multiples, &c.*

### EXAMPLE 5.

Required the least Number that will answer the following Conditions, *viz.* when divided by 8 shall leave 4 for a Remainder, when divided by 7 shall leave 3, and when divided by 6 shall leave 2, and so on leaving each time 4 for a Remainder less than the Divisor, till divided by 4, nothing shall remain?

The *least Common Multiple* of the given Divisors 8, 7, 6, 5 and 4 will (by the *Rule*) be easily found to be 840, which being the least Number that can be divided by those Divisors without leaving any Remainder, therefore from 840 deduct 4 and the Remainder will be 836 the Number required.

### EXAMPLE 6.

*Quere* the four least Numbers that will answer the following conditions, *viz.* when divided severally by 12 shall each leave 11 for a Remainder, when divided severally by 11 shall each leave 10, and so on, always leaving one less than the Divisor, to Unity?

The *least Common Multiple* of the given Divisors 12, 11, 10, 9, 8, 7, 6, 5, 4, 3, 2 and 1 will be easily found (by the *Rule*) to be 27720 which multiply severally by 2, 3 and 4 and the Products will be 55440, 83160 and 110880, which several Numbers, *viz.* 27720, 55440, 83160 and 110880 are the four least Numbers that can be divided by the given Divisors without leaving any Remainder, from which several Numbers deduct Unity and the Remainders will be 27719, 55439, 83159 and 110879 the four least Numbers required.

And now having shewn how to find the *least Common Multiple* of any proposed Numbers, it may not be amiss just to observe that it is of excellent use in  
*reducing*

## *To find least Common Multiples, &c.* 459

*reducing Fractions to their least Common Denominator, and is the Ground and Explanation of the former part of the Note to Case 9 in page 251, for it is plain, that the least Common Multiple of the Denominators is always the least Common Denominator that the Fractions can be reduced to, and in order to find the new Numerators thereto, divide the several Products arising from the least Common Denominator being multiplied into each Numerator, by the respective Denominators, and the several Quotients will be the new Numerators required. Or, the least Common Denominator divided by each Denominator separately, and the Quotients multiplied by their respective Numerators will also produce the new Numerators required, but this being so plain and easy I shall in this place say no more in relation thereto, but proceed to the next thing proposed, namely*

### A COLLECTION OF NEW QUESTIONS

*to exercise all the Rules in this Treatise.*

1. **I**N the *Old and New Testament*, tell unto me  
What Number of Chapters contained there be?

*Answer, 1189.*

2. *John* borrow'd of his Friend some cash  
In part he soon paid down  
Twelve golden Guineas,—still unpaid  
A Noble and a Crown.  
What did he borrow tell me true  
In royal *British* Coin?  
This *Tyro* you may quickly do,  
To make your learning shine:

£ s d  
*Answer, 13 3 8.*

Q 9 2

3. Sup:

3. Suppose *Thomas* and *Harry* buy a Piece of Timber containing 104 solid Feet, and that *Harry* is to have 67 Feet. *Quere Thomas's Share?*

*Answer, 37 Feet.*

4. Suppose a Tradesman be indebted to *A* £ 147 16s 11d, to *B* £ 400 15s 7d  $\frac{1}{2}$ , to *C* £ 340 19 4  $\frac{3}{4}$ , to *D* £ 64 15s and to *E* £ 500, and that towards the Payment of these Debts, he has in Cash, £ 145, in Shop-goods £ 164 18s 4d, in Household Furniture £ 210 14s 10d, in a Tenement 40 Guineas and a Mark, and in recoverable Book-Debts £ 100 15s 4d  $\frac{1}{2}$ . Now if these things be delivered to his Creditors, what wou'd they then lose by him?

*Answer, £ 790 5 -  $\frac{3}{4}$ .*

5. Suppose a Person die and leave his two Sons *A* and *B* to pay a certain Debt equally, out of their respective Fortunes, and that *A* has paid £ 60 11s 4d  $\frac{1}{2}$ , toward such Debt, and *B* £ 40 16s 10d, and that there still remains due £ 20 14s 6d  $\frac{1}{2}$ . *Quere, What has each yet to pay (as they must pay equally) of the above-mentioned Debt, and what was the Debt the Father left 'em to pay?*

*Answer, A } must pay { £ 10 -  
B }                    { 20 4 6  $\frac{1}{2}$   
and the whole Debt was £ 122 2s 9d.*

6. What Number taken from 12 times 64, will leave 15 times 24?

*Answer, 408.*

7. Miss *Nancy* said—*Mamma* I find  
Your Age is thirty-two,  
And I just fourteen to my mind,  
This you'll allow is true:

*What*

What will our Ages be declare,  
When I am half as old  
As you *Mamma*? 'tis very fair  
The Question shou'd be told.

*Answer*, 36 and 18.

8. Suppose a Farmer sell the following quantity of Corn, viz.

140	} Bushels of	Wheat	} at	7 3	} per Bush.
60		Rye		4 2	
346		Oats		2 9 $\frac{1}{2}$	
and 270		Barley		3 6 $\frac{1}{2}$	

What does the whole Quantity amount to?

*Answer*, £ 159 7 2.

9. What Number multiplied by 1234 will produce 64168?

*Answer*, 52.

10. Suppose a Sawyer having measured a certain Number of Boards found them to contain 3400 Square Feet. How many Roods (of 400 Feet to the Rood) are contained therein?

*Answer*, 8  $\frac{1}{2}$  Roods.

11. Admit a Gentleman wou'd divide 600 Acres of Land amongst his three Sons *A*, *B* and *C*, in such manner that *A* } must have { 68 } Acres more than { *B*  
and *B* } { 50 } { *C*

What Quantity of the (600 Acres) must each have?

*Answer*, *A* } must have { 262 } Acres.  
*B* } { 194 }  
and *C* } { 144 }

12. Suppose a Gentleman to have 3840 Fruit Trees, in five different Nurseries, and the greatest Nursery to exceed

$$\text{the } \left\{ \begin{array}{l} 2\text{d,} \\ 3\text{d,} \\ 4\text{th,} \end{array} \right\} \text{ by } \left\{ \begin{array}{l} 64 \\ 146 \\ 280 \\ 310 \end{array} \right\} \text{ Trees,}$$

and the 5th,

*Quere*, the Number of Trees in each Nursery?

*Answer*, 928, 864, 782, 648 and 618 Trees.

13. Suppose Miss *Charlotte's* and Miss *Fanny's* Fortunes added together make £1000, and that if you deduct the less Sum *viz.* *Fanny's* from the other, the remainder wou'd be £76 10s  $-d \frac{1}{2}$ . *Quere*, the respective Fortunes?

$$\text{Answer, } \left. \begin{array}{l} \text{Charlotte's} \\ \text{and Fanny's} \end{array} \right\} \text{ Fortune } \left\{ \begin{array}{lcl} \text{£} & \text{s} & \text{d} \\ 538 & 5 & -\frac{1}{4} \\ 461 & 14 & 11\frac{1}{4} \end{array} \right.$$

14. Suppose *Job*, *Ralph*, *George* and *Thomas* have a Prize of £6489, and agree to divide it in such manner that as oft as

$$\left. \begin{array}{l} \text{Job} \\ \text{Ralph} \\ \text{George} \\ \text{and Thomas} \end{array} \right\} \text{ takes } \left\{ \begin{array}{l} \text{a Crown,} \\ \text{half a Crown,} \\ \text{a Shilling,} \\ \text{Sixpence,} \end{array} \right.$$

*Quere*, each man's Share according to the above-mentioned agreement?

$$\text{Answer, } \left. \begin{array}{l} \text{Job's} \\ \text{Ralph's} \\ \text{George's} \\ \text{and Thomas's} \end{array} \right\} \text{ Share is } \left\{ \begin{array}{lcl} \text{£} & \text{s} & \\ 3605 & — & \\ 1802 & 10 & \\ 721 & — & \\ 360 & 10. & \end{array} \right.$$

15. If 4 Hogsheads of strong Beer were to be bottled off into Quart Bottles. How many Dozen wou'd they fill?

*Answer*, 68 Dozen.

16. In

*A Collection of new Questions.*

463

16. In 340 Ducatoons at 6s 4d each. How many Florins at 3s 2d each? *Answer, 680 Florins.*

17. How many Canisters of Tea each holding 16 lb can be filled out of 11 C. 1 qr. 20 lb?

*Answer, 80 Canisters.*

18. If 3 C. 1 qr. 24 lb of Currants cost £6 17s 5d. How were they sold per lb when the Profit arising thereby came to £1 4s 3d? *Answer, 5d.*

19. Suppose I bought two hundred Eggs,

One half at five a penny,

The other half but four \* I had, \* a penny.

I cou'd not get so many.

T'oblige a Neighbour after, I

Dispose of all this Ware,

And nothing for my Profit get,

How were they sold † declare?

† i. e. how  
many Eggs  
a penny.

*Answer, 4  $\frac{2}{3}$  viz. 4  $\frac{1}{2}$  nearly.*

20. Suppose a Shepherd buys 200 Sheep for £85 and after sometime sells them again for £105. Now suppose they had cost him at first £105. What must they be sold for to gain after the same Rate?

*Answer, 129 14 1  $\frac{1}{4}$   $\frac{11}{17}$ .*

21. Sound being found by Experiment to move 1142 Feet in 1 Second of Time. *Quere,* How long after the firing of a Cannon at *Chester*, may the report be heard at *Whitchurch*, distant 20 Miles?

*Answer, 1 Minute 32  $\frac{268}{371}$  Seconds.*

22. Admit on any certain Day at 8 o'Clock in the Morning a person sets out from *Whitchurch* to *London* which is 162 Miles, and goes at the rate of 2  $\frac{1}{2}$  Miles per Hour, and that another person sets out from *London* for *Whitchurch* at 3 o'Clock in the Evening of the

the same Day, and comes down at the Rate of  $3\frac{1}{2}$  Miles an Hour. *Quere*, How far distant betwixt London and *Whitchurch* wou'd they meet?

Miles	Mls.	Fur.	P's.	Yds.		
<i>Ans.</i> $78\frac{9}{11}$	78	6	21	$4\frac{1}{2}$	=	$\left\{ \begin{array}{l} \text{London} \\ \text{Whitch.} \end{array} \right.$
and $83\frac{2}{11}$						

23. *A* working alone in twelve Days can compleat The making a Vessel of Copper quite neat, Which wou'd take sixteen Days to be made up by *B*, He working more slowly than *A* you may see. Now working together, what Time will they take Before the said Vessel compleatly they'll make?

*Answer*,  $6\frac{6}{7}$  Days.

24. Suppose a Gentleman having an Estate of £200 *per Annum* wou'd divide the same into two Farms, so as to be in proportion to each other as 3 to 5. *Quere*, the yearly Value of each?

*Answer*, £75 and £125.

25. Suppose a Garrison consisting of 8000 Soldiers be besieged and that they have Provisions to serve 'em five Months. How many Men must depart therefrom in order that the Provisions might serve the Remainder 8 months? *Answer*, 3000 Men.

26. *Jack Queer* a scold has to his spouse,  
*Old Xantippe* outvies,  
 She bangs him round about the house,  
 Makes a perpetual noise.  
*Dick Hog* too, has a drunken wife,  
 Who much consumes his store,  
 And makes him an unhappy life,  
 Thinking he shall grow poor.  
 At landlord *Gill's*, to have a whet  
 Of ale or beer they say,  
 These two unhappy husbands met,  
 Upon a certain day.

Whilst

Whilst drinking their discourse began

'Bout changing of their wives,

And as they tols about the Can,

*Dick* wiping of his eyes.

Says *Jack* a bargain I will make,

But something more shall crave,

Than just your wife because you know

Mine's nearer to the grave,

Each age I find's as *two* to *three*,

Their sum *one hundred years*,

So boot in hand, dear *Dick* must be,

As plainly now appears.

Says *Dick* to *Jack* I'll give to you

T'bacco as many pound,

As your wife's age exceedeth mine,

So let the Can go round.

The bargain's struck—each age unfold,

And what the whole comes to

Of the tobacco at the price

You in the margin view.  $\text{d}$   $\text{14} \frac{1}{2}$  per  $\text{lb}$

*Answer, Jack's } Wife's Age { 60 } Years,  
Dick's } { 40 }*

and the price of the 20 $\text{lb}$  of tobacco £1 4s 2d.

27. Suppose a Regiment of Soldiers consisting of 800 men are to be new clothed and that each man's coat will take  $2 \frac{3}{4}$  Yards, of yard and half wide Cloth. How many Yards of shalloon of three quarters wide will line the same? *Answer, 4400 Yards.*

28. Suppose a round Ball weighing  $1 \frac{1}{2}$   $\text{lb}$  be impelled by such a force as to make it fly 380 Feet in one second of time. With what velocity would a Bullet of  $\frac{1}{4}$   $\text{lb}$  weight move, if impelled by the same force? *Answer, 2280 Feet.*

29. Admit a Cistern holding 140 Gallons be supplied by a pipe with water at the rate of 48 gallons an

hour. In what time (supposing the influx and efflux of the water to be always alike) wou'd the Cistern be fill'd if both the pipes were set open at once ?

*Answer,* 10 Hours.

30. If a clock having two hands turning upon the same center or axis, be observed to have the following Motion *viz.*

the slower } Hand to move  $\left\{ \begin{matrix} 3 \\ 2\frac{1}{2} \end{matrix} \right\}$  Rounds in  $\left\{ \begin{matrix} 2\frac{1}{2} \\ 2 \end{matrix} \right\}$  Hours.  
and the swifter }

*Quere,* the Synodical Period of the two Hands (*i. e.* the time they would take in getting together again from their setting out together at one and the same place) and how many Revolutions wou'd each Hand make in such Period ?

*Answer,* Synodical Period 20 Hours, in which time the slower hand wou'd make 24 Revolutions and consequently the other 25.

31. If 8 Cows or 11 Heifers wou'd eat a field of Grass in 108 Days, In what time (after the same rate of eating) wou'd 4 Cows and 5 Heifers eat the same ?

*Answer,*  $113\frac{1}{7}$  Days.

32. Suppose twelve men six pounds in 8 days earn,  
How many men must be you'll soon discern  
To earn just fifty Guineas, and no more  
In twenty days—This *Tyro* pray explore.

*Answer,* 42 Men.

33. If 10 men can build a boat in 20 days when the day is 14 hours long. In how many days (after the same rate of working) cou'd 18 men build the same when the day is 11 hours long ?

*Answer,*  $14\frac{14}{99}$  Days.

34. In

34. In 8 Casks of Tobacco each containing 8C. 1qr. and 24lb. Tare 3qrs. 20lb per Cask, Trett 4lb per 104lb. and Cloff 3lb for every 3C. Gross. What does the Neat Weight come to at  $8\frac{1}{4}d$  per lb?

£ s d

*Answer,* 219 17 9 -  $\frac{6}{83}$ .

35. If 6 Casks of Oil weigh 20C. 1qr. 2lb Gross. How many Gallons, allowing 20lb per C. Tare, and  $7\frac{1}{2}$  lb. to the Gallon?

*Answer,* 248  $\frac{13}{17}$  Gallons.

36. Suppose a May-Pole be broke in two Parts, and that the standing Part is  $11\frac{1}{4}$  Feet more

than  $\frac{3}{4}$  } of  $\left\{\frac{5}{9}\right\}$  of the whole.  
and the other Part just  $\frac{1}{2}$  }

*Quere,* the Length of the whole Pole, and also the Length of each Part?

*Ans.* 54 } Feet, the Length of the { whole Pole,  
33  $\frac{3}{4}$  } { standing } Part.  
and 20  $\frac{1}{4}$  } { other }

37. Admit a Tower or Landmark be

$\frac{1}{4}$  } in the { Ground  
 $\frac{1}{10}$  } { Water

and 116 Feet above the Water. *Quere,* the whole Height thereof?

*Answer,* 140 Feet.

38. Admit 12 Gallons of Beer were drawn out of a Cask after it had leaked away  $\frac{1}{9}$  of the whole. What did the Cask hold, when upon being guaged there remained undrawn  $\frac{5}{9}$  of the whole Quantity?

*Answer,* 36 Gallons.

39. Once drunken *John* to th' Alehouse went,  
T' be fuddl'd was his whole intent,  
One fifth o'th money in his purse,  
Spent at the *George* and to make worse,  
He reel'd away unto the *Bear*,  
Three ninths of what he'd left spent there,

At

At last when to his senses come,  
 He counts his cash to know what Sum  
 Was left behind—which was no more  
 Than ten \* and eight Pence, so explore \* Shils.  
 What Sum at first his Purse had in  
 Ere this wild frolic did begin ?

*Answer, 20 Shillings.*

40. Suppose a Person dies and leaves the whole  
 of his Estate amounting to £4060 to be divided a-  
 mongst his 6 Sons in the following manner, *viz.*

the  $\left\{ \begin{array}{l} 2^{\text{d}} \\ 3^{\text{d}} \\ 4^{\text{th}} \\ 5^{\text{th}} \end{array} \right\}$  Son to have  $\left\{ \begin{array}{l} \frac{3}{4} \\ \frac{1}{2} \\ \frac{1}{4} \\ \frac{3}{4} \\ \frac{1}{2} \end{array} \right\}$  of the  $\left\{ \begin{array}{l} \text{Eldest} \\ 4^{\text{th}} \\ 5^{\text{th}} \end{array} \right\}$  Son's share  
 and the 6th

How much of the £4060 must each Son receive ?

		£	s	d
<i>Answer,</i> $\left\{ \begin{array}{l} 1^{\text{st}} \\ 2^{\text{d}} \\ 3^{\text{d}} \\ 4^{\text{th}} \\ 5^{\text{th}} \\ \text{and the 6th} \end{array} \right\}$	Son's Share	1459	15	6 - $\frac{24}{89}$
		1094	16	7 $\frac{1}{2}$ $\frac{18}{89}$
		729	17	9 - $\frac{12}{89}$
		364	18	10 $\frac{1}{2}$ $\frac{6}{89}$
		273	14	1 $\frac{3}{4}$ $\frac{49}{89}$
		136	17	- $\frac{1}{4}$ $\frac{69}{89}$

41. A Roman Lawyer as the story goes,  
 A Question of this kind did first propose,  
 That if a person die and leave behind  
 His whole Estate (th' Amount is here subjoin'd \*)  
 And Wife with Child then 'tis his will and mind  
 If of a Son she shou'd deliver'd be,  
 Two thirds must be his Share, one third for she.  
 But if a Daughter, then the Widow's Share,  
 Must be two thirds, the Daughter's one 3d clear.

\* £8000 per Annum.

Now

Now soon the Widow is, as we descry,  
 Deliver'd of a Daughter and a Boy.  
 T'answer the Father's Will, now tell to me  
 How th' 'state with Justice must divided be?

		£	s	d	
<i>Ans.</i> Son's	} Share	4571	8	6 $\frac{3}{4}$ $\frac{3}{7}$	} <i>per Ann!</i>
Mother's		2285	14	3 $\frac{1}{4}$ $\frac{5}{7}$	
and Daughter's		1142	17	1 $\frac{1}{2}$ $\frac{6}{7}$	

42. Old *Derby* bought a pretty House,  
 To live in at his Ease,  
 At the Desire of *Joan* his Spouse,  
 Whom he always strove t'please:  
 But Death soon snatch'd them both away,  
 To the *Elysian* Bow'r,  
 And *Derby* left his House they say  
 To *Hodge*, who blest the Hour  
 That Fortune had so smil'd upon  
 Him, now in time of need,  
 Because he had — O! silly Man,  
 Spent all he had indeed.  
 And thro' Extravagance we find,  
 The House was quickly sold,  
 For just three fourths of what it cost,  
 O! shocking to be told.  
 His Debtors swarm about like Bees,  
 Three of them *A, B, C*,  
 Now will be paid or else to Goal,  
 They'll send him instantly.  
 And Landlord *Swilltub* does protest,  
 Unless he'll pay his Score,  
 For Ale and Liquor of the best,  
 He shan't have Freedom more,  
 But rot in Goal — for ought he cares!  
 How hard-heart'd Landlords be!  
 Their tempting Baits and dainty Wares  
 Bring Men to Poverty.

R r

*Hodge*

*Hodge* being seiz'd, no more cou'd do,  
 But pay to Debtors three,  
 One third, two ninths, three fifteenths—so  
 He paid *A*, *B* and *C*.  
 One fifth to *Swilltub* likewise paid—  
 When of these Sums bereft,  
 Three Pounds six Shillings and eight Pence,  
 Was all that *Hodge* had left.  
 Still, still perplex'd with clam'rous din,  
 For drabbling debts was he,  
 Till ev'ry Farthing's paid and gone—  
 Now *Tyro* tell to me,  
 What Cash the House was sold for—too  
 What *Derby* paid likewise  
 For it—All this with Ease you'll do,  
 And to Mount Science rise.

*Answer*, the House was sold for £75 and cost £100.

*Note*. This Question, viz. the 42d, is proposed as a Caution to shun ill Company and Extravagance.

43. Now we'll suppose from th' Center of a Tow'r,  
 On level Ground one hundred Yards and four,  
 And from the bottom of this lofty Pile,  
 Unto the Top two eightieths of a Mile.  
 A Rope from th' Top quite reaches to the Ground,  
 Whose Length in Yards may easily be found.  
 A Flyer on this Rope descends in flight,  
 From th' Tower's Top he takes amazing Flight.  
 —This scaling Rope's true Length with ease you'll

[find,  
 From *Euclid's* Rule \* that's hereunto subjoin'd.

\* In every right angled Triangle

the { Sum } of the { Base } { Perp }  
 and the { Diff. } of the { Hyp. } { Base }  
 { Squares } of the { Squares } { Squares }  
 { of the } { of the } { of the }  
 { Base } { Hyp. } { Base }  
 { Squares } { Squares } { Squares }  
 { of the } { of the } { of the }  
 { Base } { Hyp. } { Base }

*Answer*, 112.924 Yards, viz. 113 nearly.

44. Admit the Height of a Castle Wall be  $60\frac{1}{2}$  Yards, and a scaling Line drawn from the Top of the Wall to the further side of the Castle Ditch  $200\frac{1}{4}$  Yards. *Quere* the Breadth of the Ditch?

*Answer*, 190.892 Yards.

45. Suppose the length of a scaling Ladder from the Ground to the top of an Edifice be 40 Feet, and from the foot of the Ladder to the bottom of the Edifice 30 Feet. What is the Altitude of the Edifice?

*Answer*, 26.457 Feet, or nearly  $26\frac{1}{2}$ .

46. Admit the height of a Mountain be 4 Miles above the surface of the Sea, and the Semidiameter of the Earth 3984.58 Miles. How far may the Mountain be seen at Sea, the eye of the spectator being supposed to be on the surface of the Water?

*Answer*, 178.585 Miles.

47. If a Pipe of a Cock whose Diameter is 2 Inches will fill a Cistern in half an Hour. What must the Diameter of another Pipe be to fill it in quarter of an Hour?

*Answer*, 2.828 Inches.

48. Admit a Cubical Stone to contain 884736 solid Inches. How many Feet of Board wou'd cover the same?

*Answer*, 384 Feet.

49. Suppose a Cellar be to be dug  $20\frac{1}{2}$  Feet every way, *i. e.* in Length, Breadth and Depth. How many solid Feet of Earth must be digged up to complete the same?

*Answer*, 8615.125 Feet =  $8615\frac{1}{8}$  Feet.

50. If a Bullet whose Diameter is  $3\frac{1}{2}$  Inches weigh  $7\frac{1}{4}$  lb. What wou'd be the Diameter of another Bullet of the same metal weighing  $40\frac{1}{2}$  lb?

*Answer*, 6.2102 Inches.

51. Suppose the sides of two Cubes be 5 and 7 Inches. Required the side of another Cube that shall be equal in solidity to the two given Ones.

*Ans.* 7.763936 *viz.* a little more than  $7\frac{3}{4}$  Inches.

R r 2

52. What

52. What is the Simple Interest of £540 8s 9d for  $8\frac{3}{4}$  Years at  $\text{£}4\frac{1}{2}$  per Cent. per Annum?

£   s   d  
Answer, 206 17 8  $\frac{1}{2}$   $\frac{2}{3}$ .

53. If *A* shou'd mortgage his Estate,  
For a thousand Pounds t' *B*,  
Allowing Int'rest at the Rate  
You in the Margin \* see.  
And that th' Sum remain'd to *B*'s mind,  
Nine Years nine Months not more,  
Before *A* cou'd a method find,  
To pay him off his score.  
Then tell to me the whole Amount,  
That *A* must pay to *B*?  
Haste Tyro, haste, begin to count,  
You'll do it instantly.

\*  $\text{£}4\frac{1}{2}$  per Cent.  
per Annum  
Simple Interest.

£   s   d  
Answer, 1463 2 6.

54. At what Rate of Simple Int. will £432 5s 10d amount to £560 10s 5d in 6 Years and 216 Days?

Answer,  $\text{£}4\frac{1}{2}$  per Cent.

55. Admit a person lent 100 Guineas at  $\text{£}5$  per Cent. per Annum, Simple Interest, and on the first day of June 1773, receiv'd £1 6s 3d for every Guinea. When must the Money have been lent?

Answer, On the first day of June, 1768.

56. Suppose a person (on one and the same day) puts out £200 at  $\text{£}4\frac{1}{2}$  per Cent. per Annum, and £260 at  $\text{£}3$  per Cent. per Annum. In what time at Simple Interest wou'd they exactly have the same Amount?

Answer, 50 Years.

57. What must a person give for £646 12s South-Sea Annuities, at  $\text{£}124\frac{1}{4}$  per Cent?    Ans. £803 8s.

58. What is the Compound Interest of £450 10s for 8 Years at  $\text{£}4$  per Cent. per Annum?

Answer, £166 -s 9  $\frac{1}{4}$ d.

59. What

59. What is the present Worth of £640 4s 3d due 3 Years and 234 Days hence at  $\text{£}4\frac{1}{2}$  per Cent. per Annum, Compound Interest? *Ans.* £545 8s  $1\frac{1}{4}$ d.

60. What will £200 amount to in  $1\frac{3}{4}$  Year at  $\text{£}4$  per Cent. per Annum Compound Interest, supposing the Interest payable quarterly? *Ans.* £214 8s  $6\frac{1}{4}$ d.

61. At what Rate per Cent. per Annum Compound Interest will £230 amount to £413 —s  $11\frac{1}{4}$ d in 12 Years? *Answer,* £5 per Cent.

62. What is the Discount of £260 10s due 4 Years hence at  $\text{£}4\frac{3}{4}$  per Cent. per Annum Simple Interest? *Answer,* £41 11s 10d —  $\frac{88}{119}$ .

63. Admit a Tradesman sell Goods to the Value of £140 10s 6d to be paid in manner following, viz.

£  
 $\left. \begin{array}{l} 50 \\ 30 \end{array} \right\}$  at the End of  $\left\{ \begin{array}{l} 3 \\ 5 \\ 8 \end{array} \right\}$  Months  
 and the rest

*Quere* the present Worth of the whole, allowing Discount at  $\text{£}6\frac{1}{2}$  per Cent. per Annum?

*Answer,* £136 8s  $4\frac{3}{4}$ d +.

64. Suppose Thomas owes Richard £200 to be paid in manner following, viz.

£  
 $\left. \begin{array}{l} 80 \\ 60 \\ 40 \end{array} \right\}$  at the End of  $\left\{ \begin{array}{l} 2 \\ 2\frac{3}{4} \\ 3\frac{1}{2} \\ 4\frac{3}{4} \end{array} \right\}$  Years  
 and 20

*Quere* the equated Time for payment of the whole?

*Answer,*  $2\frac{4}{5}$  Years.

65. Suppose a person be under an Agreement to discharge a Debt in the following manner, viz.

$\left. \begin{array}{l} \frac{1}{3} \\ \frac{1}{4} \end{array} \right\}$  at the End of  $\left\{ \begin{array}{l} 10 \\ 16 \\ 20 \end{array} \right\}$  Months  
 and the Remainder

*Quere* the equated time for Payment of the whole?

*Answer,*  $15\frac{2}{3}$  Months,

R r 3

66. Sup-

66. Suppose a Clothier buys Goods to the value of £300 and by Agreement is to pay the same at the End of 4 Months, Now admit he pays £60 in hand in order to procure a longer time for the Payment of the remainder. In what time ought the remainder to be paid?

*Answer,* 5 Months.

67. Suppose four persons *A*, *B*, *C* and *D* purchase an Estate and agree that *A* shall pay  $\frac{2}{7}$  of the Purchase Money, *B*  $\frac{3}{15}$ , *C*  $\frac{1}{6}$  and *D* the rest, viz. £2800. *Quere* the Purchase Money, and what must *A*, *B* and *C* respectively pay, and also what part of the Estate must *D* have?

*Answer,* Purchase Money £12000 whereof *A* must pay £4800, *B* £2400 and *C* £2000, and *D* must have  $\frac{7}{10}$  of the Estate.

68. Suppose 3 Reapers *A*, *B* and *C* reaped a certain Number of Acres for £5 8s and that they wrought such Parts as are hereafter mentioned, viz.

$\left. \begin{array}{l} A \\ A \\ \text{and } B \end{array} \right\}$  and  $\left\{ \begin{array}{l} B \frac{1}{2} \\ C \frac{5}{6} \\ C \frac{2}{3} \end{array} \right\}$  of the Work

*Quere* what must each Man receive to be paid in proportion to his Work?

*Answer.*  $\begin{array}{ccc} \text{£} & \text{s} & \text{£} \\ A & 1 \ 16, & B \ 18 \text{ and } C \ 2 \ 14. \end{array}$

69. Suppose *A*, *B* and *C* purchased a Machine for £120 and the Profit thereof by agreement to be divided amongst them in Proportion to the Sums they respectively paid which were as follow, viz. for every £8 *A* paid, *B* paid £5 and *C* £3, Now suppose they clear £40 *per Cent*. What is each person's Stock with respect to the Sum paid and Gain *per Cent*?

*Ans.* *A*'s Stock £150, *B*'s £93 15s and *C*'s £56 5s.

70. Suppose 15 Men, 20 Women and 12 Servants, were to pay 30s and that for every 8d a Man pays, a Woman must pay 5d and a Servant 3d. What must each person pay?

*Ans.*  $\left. \begin{array}{l} 11 \frac{1}{3} \\ 7 \frac{1}{12} \\ \text{and } 4 \frac{7}{12} \end{array} \right\}$  each  $\left\{ \begin{array}{l} \text{Man's} \\ \text{Woman's} \\ \text{Servant's} \end{array} \right\}$  Share.

71. Suppose *A* and *B* made a joint Stock and that *A*'s Money lay  $2\frac{1}{4}$  Years and *B*'s but  $1\frac{3}{4}$  Year. Now if *A* advanc'd £240 10s towards the Stock. What must *B* have advanc'd thereto in order to have an equal Share of the Gain?

*Answer*, £432 18s.

72. Suppose four Persons enter'd into Partnership and gain'd £180, and that *A* put into the Stock

$$\left. \begin{array}{r} \text{£} \\ 80 \\ B \quad 90 \\ C \quad 100 \\ \text{and } D \quad 110 \end{array} \right\} \text{ for } \left\{ \begin{array}{r} 6 \\ 10 \\ 14 \\ 16 \end{array} \right\} \text{ Months}$$

*Quere* each Person's Share of the Gain?

$$\begin{array}{l} \text{Answer, } A's \\ B's \\ C's \\ \text{and } D's \end{array} \left\} \text{ Share } \begin{array}{l} \text{£} \quad s \quad d \\ \left\{ \begin{array}{l} 19 \quad - \quad 7\frac{1}{2} \quad \frac{137}{227} \\ 35 \quad 13 \quad 7\frac{3}{4} \quad \frac{115}{227} \\ 55 \quad 10 \quad 1\frac{1}{2} \quad \frac{78}{227} \\ 69 \quad 15 \quad 7 - \quad \frac{124}{227} \end{array} \right. \end{array}$$

73. Suppose *A* and *B* enter into Partnership and that *A* puts into the Stock £30 for 8 Months. *Quere* how long must *B*'s £40 continue therein in order to have an equal Share of the Gain?

*Answer*, 6 Months.

74. Suppose *A* hath 80 pair of Stockings worth

$$\left. \begin{array}{r} s \quad d \\ 2 \quad 6 \\ \text{but } 3 \quad 2 \end{array} \right\} \text{ a pair } \left\{ \begin{array}{l} \text{ready Money} \\ \text{in barter} \end{array} \right.$$

and that *B* hath Worsted worth 1s 7d a pound ready Money. Now if these two Persons barter. How much Worsted must *B* give *A* for the 80 pair of Stockings?

*lb.*

*Answer*, 126  $\frac{6}{19}$ .

\* R r 3

75. Sup-

75. Suppose *B* a Butcher in order to clear £40 on a Bargain with *D* a Drover rates a certain Number of Lean Cows at £5  $\frac{1}{4}$  a piece which cost him but £4  $\frac{1}{4}$  a piece and that the Drover being apprized of that, raises the price of his Fat Cows which cost £10 a piece to an adequate price. *Quere* the Number of Fat Cows the Drover must deliver to the Butcher?

*Answer*, 16 Fat Cows for 40 Lean Ones.

76. Suppose *A* hath Woollen Cloth worth

$\begin{array}{r} s \quad d \\ 5 \quad - \\ \text{but } 6 \quad 6 \end{array} \left. \vphantom{\begin{array}{r} s \quad d \\ 5 \quad - \\ \text{but } 6 \quad 6 \end{array}} \right\} \text{a Yard} \left\{ \begin{array}{l} \text{ready Money} \\ \text{in barter} \end{array} \right.$

and wou'd barter 60 Yards of this Cloth with *B* for Wheat at 8s 6d a Bushel but wou'd be willing to abate £.15 *per Cent.* to have *half* ready Money. *Quere* the ready Money Price of a Bushel of this Corn, and how much must be delivered, paying one half ready Money?

$s \quad d$

*Answer*, 6  $6 \frac{3}{4} \frac{11}{12}$  the Price of a Bushel, and 19  $\frac{1}{2}$  Bushels to be delivered.

77. Admit a Person sold a Horse for 20 Guineas and lost thereby £24 *per Cent.* How much ought he to have sold the Horse for, in order to have gain'd as much *per Cent.* as he cost him?

$\begin{array}{r} £ \quad s \quad d \\ \text{Answer, } 35 \quad 5 \quad 3 \frac{1}{4} \frac{3}{8} \frac{5}{16} \end{array}$

78. Suppose a Person bought a Hog for 30s and that the fattening of which cost  $\frac{2}{3}$  of what he was sold for, and that by selling him at 4d  $\frac{1}{4}$  *per lb.* there was gain'd as much as he cost at first. *Quere* the Weight and what he was sold for? *lb.*

*Answer*, £5, and the Weight 252  $\frac{2}{3}$ .

79. Sup-

80. Suppose a Person bought a parcel of Hops at  $11d\frac{1}{2}$  per lb. but not proving good Ones is willing to sell them so as to lose £10 per Cent. How much per lb. must they be sold for?

*d*  
Answer,  $10\frac{1}{4}\frac{2}{3}$ .

81. If by selling Goods at £2 12s per Cwt. there be gain'd £20 per Cent. What wou'd have been gain'd per Cent. if they had been sold at £3 15s per Cwt?

£ s d  
Answer, 73 1 6  $\frac{1}{4}\frac{11}{13}$ .

82. John sold his Horse for fifteen pound,  
And lost just twelve \* per Cent. \* £  
But shou'd have cleared as he found,  
Fifteen † by just Account. † £ per Cent.  
Then how much under Value say,  
Has John's fine Horse been sold?  
Come Tyro tell without Delay,  
You'll this with ease unfold.

£ s d  
Answer, 4 12 -  $\frac{1}{2}\frac{2}{11}$ .

83. If a Draper sold Cloth at £5 6d a Yard, and gain'd £8 per Cent. thereby. What wou'd he have gain'd per Cent. if he had sold it at 6s 4d per Yard?

£ s d  
Answer, 24 7 3  $\frac{1}{4}\frac{1}{11}$ .

84. In 135 Crowns, 34 Sols. How much Sterling at 2s 7d  $\frac{3}{4}$  per Crown?

£ s d  
Answer, 17 18 8 -  $\frac{22}{80}$ .

85. Sup-

85. Suppose a Merchant at *London* remit to *Amsterdam* two Bills of Exchange each £300

s      d

the one } at { 33 4 } Flemish per £ Sterling.  
and the other } at { 33 7  $\frac{1}{4}$  }

How many Guilders Bank } Money { and  
how many Current } are  
contained therein, *Agio* at  $4\frac{3}{4}$  per Cent?

Guilds. Stiv. Pen.

*Ans.* 6026      5      —      Bank } Money.  
and 6289      17       $15\frac{1}{2}$       Current }

86. Admit a Merchant to be under a Necessity to exchange £140 *Sterling* for Dollars or Crowns and is offered

s      d

and { the { Dollars } at { 4 6 } piece which are worth but { 4 3 } piece  
         { Crowns } at { 5 — } a piece      { 4 8 } a piece

The Question is which he must take to lose the least Money by, and how many of that sort must he receive?

*Answer,*  $622\frac{2}{3}$  Dollars.

If 4 } Yards of { Cloth } be worth { 7 } Yards { of { Fustian  
5 } { Fustian } { 9 } { Shalloon  
3 } { Shalloon } { 4 } { Flannel  
and 2 } { Flannel } { 2 pair } { Gloves

Then how many Yards of Cloth wou'd be worth 30 pair of Gloves?

*Answer,*  $7\frac{1}{4}$  Yards.

87. If a Goldsmith melt the following Quantities of Gold together, *viz.*

8 }  
16 } oz. of { 20 }  
and 18 } { 17 } Carats fine  
         { 21 }

*Quere* the fineness of the Composition?

*Answer,*  $19\frac{2}{7}$ .

88. • If

88. \* If a Vintner were to mix the following Wines, viz.

	<i>s</i>	<i>d</i>			
Canary	}	at	{		
Malaga				2	4
and Sherry				2	8
			}		
			{		
			1	8	

per Quart with Water, so that the Mixture may be worth 2*s* a Quart. How much of each sort must he take?

*Answer,* 1 } Quart } of { Canary  
                   1 }                { Sherry  
                   6 } Quarts }       { Malaga  
                   and 2 }               { Water.

89. \* Suppose a Grocer mixes 30*lb* of Sugar at 4*d* per *lb*, with three other sorts at 5*d*, 7*d* and 8*d* per *lb*, and charges the same at 6*d* per *lb*. What wou'd the Weight of the Mixture be? *Answer,* 90*lb*.

90. \* Admit a Grocer wou'd mix four different sorts of Tea, viz. at 5*s*, 6*s*, 7*s* and 9*s* per *lb*, in order to sell the whole Mixture of 80*lb* at 8*s* per *lb*. How much of each sort must he take?

*Answer,* 8  $\frac{2}{3}$  *lb* of each of the three first sorts, viz. at 5*s*, 6*s* and 7*s* } per *lb*.  
 and 53  $\frac{1}{3}$  *lb* of that at 9*s* }

\* *Note* These three Questions, viz. 88, 89 and 90 are indeterminate and will admit of various Answers each, as may be seen in page 398.

91. Suppose a Debt is to be discharged at six different Payments in Arithmetical Progression, and that the first Payment is to be £4 and the last £80. *Quere* the whole Debt and what each Payment must be?

*Ans.* £252 the whole Debt =  $\begin{matrix} \text{£} & \text{£ } s & \text{£ } s & \text{£ } s \\ 4 & + 19 & 4 & + 34 & 8 & + 49 & 12 \\ \text{£ } s & & \text{£} & & & & \\ + 64 & 16 & + & 80 & \text{the six different Payments.} \end{matrix}$

92. Admit

Then ask'd him the price of the Buttons he'd sell,  
 What they're worth says the Cocker I cannot now tell.  
 But if ev'ry Button you'll treble for me,  
 With one Barley Corn \* then the Buttons shall be,  
 Your own—To this Bargain the Farmer agreed  
 And began to count up the whole Number with speed. }  
 But to his Surprize found he's bilked indeed. }  
 For the Barley Corns growing upon all his Land,  
 Were nothing to what was the Cocker's Demand.

*Quere* the Number of Barley Corns, and Number of Bushels and also what it will amount to at 4s 4d. a Bushel allowing 681 Grains of Barley to an Ounce, 16 Ounces to the pound, and 50 pounds to the Bushel (that is to say) 544800 Grains to every Bushel?

*Answer* 21195579137608101757147216600 Barley Corns, viz. twenty one thousand one hundred and ninety five millions of millions of millions of millions, five hundred and seventy nine thousand one hundred and thirty seven millions of millions of millions, six hundred and eight thousand one hundred and one millions of millions, seven hundred and fifty seven thousand one hundred and forty seven millions, two hundred sixteen thousand and six hundred, which at 544800 Grains to the Bushel make 38905248049941449627656  $\frac{1}{2} \frac{1}{4} \frac{3}{4}$  Bushels, viz. thirty eight thousand nine hundred and five millions of millions of millions, two hundred and forty eight thousand and forty nine millions of millions, nine hundred and forty one thousand four hundred and forty nine millions, six hundred and twenty seven thousand six hundred and fifty six Bushels and a little more than a Peck, which at 4s 4d a Bushel amount to £8429470410820647419325 11s 1  $\frac{1}{2}$ d, in words, eight thousand four hundred and twenty nine millions of milli-

---

\* i. e. One Barley Corn for the first Button, 3 for the second and so on, trebling each time to the last.

ons of millions, four hundred and seventy thousand four hundred and ten millions of millions, eight hundred and twenty thousand six hundred and forty seven millions, four hundred and nineteen thousand three hundred and twenty five pounds, eleven shillings and three halfpence, which Sum is so very great that if it were possible for nine hundred thousand men to pay each, nine hundred thousand pounds a day, they wou'd (at that great daily Sum and at 365 Days to the Year) be more than twenty eight millions five hundred and eleven thousand six hundred and fifty Years, in paying the same — **SUCH IS THE AMAZING POWER OF NUMBERS!**

- 96 Ingenious Tyro tell me pray,  
How many diff'rent hands there may  
(Of Cards ) be held at th' Game of Whist?  
But pray in Gaming don't persist.

This Question is the same as if one were to ask how many different Parcels of 13 in each Parcel, may be taken out of 52, i. e. how many Combinations of 13 in 52?

*Answer,* 635013559600.

97. Suppose three Timber Merchants *A*, *B* and *C*, bought a Parcel of Timber for £340 11s 6d and that

$A$  paid  $\frac{2}{3}$  } as much as  $\left\{ \begin{array}{l} B \\ C \end{array} \right.$   
and  $B$   $\frac{1}{3}$

*Quere* what did each pay?

*Ans.*  $\begin{array}{ccc} \text{£} & \text{s} & \text{d} \end{array}$   $\begin{array}{ccc} \text{£} & \text{s} & \text{d} \end{array}$   $\begin{array}{ccc} \text{£} & \text{s} & \text{d} \end{array}$   
*A* paid 17 18 6, *B* 53 15 6, and *C* 268 17 6.

98. Admit a Person paid a Debt of £45 with Guineas and Moidores, and that for every Moidore he paid 3 Guineas *Quere* the Number of each?

*Answer,* 30 Guineas and 10 Moidores.

99. Admit

99. Admit a Farmer paid £4 8s amongst his Labourers in manner following viz.

to every  $\left\{ \begin{array}{l} \text{Man} \quad 12 \\ \text{Woman} \quad 6 \end{array} \right\} d$   
and to every Boy 4

and that  $\left\{ \begin{array}{l} \text{Boy} \\ \text{Woman} \end{array} \right\}$  for every  $\left\{ \begin{array}{l} \text{Boy} \\ \text{Woman} \end{array} \right\}$  there were  $\left\{ \begin{array}{l} 2 \text{ Women} \\ 3 \text{ Men.} \end{array} \right\}$

*Quere* the Number of each?

*Answer,* 12 Boys, 24 Women, and 72 Men.

100. Suppose a Gentleman as he rode through a Village observ'd the people erecting a May-Pole and that upon his asking the Height was answer'd, that if and  $\frac{2}{3}$  of the Height  $\left\{ \begin{array}{l} \text{be multiply'd by 6} \\ \text{deducted from that Product} \end{array} \right\}$  the remainder will be 215 Feet. *Quere* the Height?

*Answer,* 20 Yards.

101. Suppose a Person on being asked what o'Clock it was replied, the Hour is

and if those  $\frac{1}{5}$  of the  $\left\{ \begin{array}{l} \text{Minutes} \end{array} \right\}$  since the Clock did strike were multiply'd  $\left\{ \begin{array}{l} \text{by } 6 \\ \text{and that Product divided by } 3, \end{array} \right\}$  the Quotient wou'd be 30. *Quere* what o'Clock it then was?

*Answer,* 40 Minutes past 8.

102. Admit a Person bought 100 Sacks of Flour of two Sorts for £92, viz.

and  $\left\{ \begin{array}{l} 60 \\ 40 \end{array} \right\}$  Sacks of a  $\left\{ \begin{array}{l} \text{fine} \\ \text{coarse} \end{array} \right\}$  Sort  
and that  $\frac{1}{4}$  more than what  $\left\{ \begin{array}{l} \text{he paid for each of the } \left\{ \begin{array}{l} 60 \\ 40 \end{array} \right\} \text{ Sacks} \end{array} \right\}$

*Quere,* what did he pay a Sack for each?

*Answer,*  $\frac{1}{16}$  £ s a Sack for the  $\left\{ \begin{array}{l} \text{fine} \\ \text{coarser} \end{array} \right\}$  Sort.

103 Admit

103. Admit a Grocer wou'd mix two sorts of Tea together, viz.

s d

the one } Sort at  $\left\{ \begin{smallmatrix} 4 & 6 \\ 5 & 8 \end{smallmatrix} \right\}$  per lb  
 and the other }

and wou'd have the whole Mixture to weigh 40 lb  
 and be worth £9 17s 6d. How much of each Sort  
 must he take for that purpose?

lb. s d

Answer, 25 } at  $\left\{ \begin{smallmatrix} 4 & 6 \\ 5 & 8 \end{smallmatrix} \right\}$  per lb.  
 and 15 }

104. A Farmer once his Lab'rour set  
 A Job—twelve days to do—  
 And sixteen pence per day he'd give,  
 But then 'twas order'd so,  
 That John shou'd forfeit eight pence, for  
 Each Day that e'er he play'd,  
 Because he apt to fuddle was,  
 So was the Bargain made..  
 At last just half a Guinea he  
 Receiv'd.—Then tell me pray,  
 What Days he work'd, what idle was?  
 Do this without delay.

Answer, Work'd  $9\frac{1}{4}$  } Days.  
 and Play'd  $2\frac{3}{4}$  }

105. Suppose a person receiv'd a Legacy of £150  
 in Six-and-thirties, Moidores and Guineas

and  $\left\{ \begin{array}{l} \text{that the whole} \\ \text{the Guineas } \frac{1}{5} \text{ of} \end{array} \right\}$  the  $\left. \begin{array}{l} \text{Number of} \\ \text{Pieces were 100} \\ \text{Moidores.} \\ \text{each?} \end{array} \right\}$   
*Quere*

Answer, 40 Six-and-thirties, 50 Moidores and 10  
 Guineas.

106. If

106. If  $\frac{2}{3}$  of my Age be added to  $\frac{3}{4}$  thereof, and  
 that  $\left\{ \begin{array}{l} \text{Sum multipli'd} \\ \text{Product divided} \end{array} \right\}$  by  $\left\{ \begin{array}{l} 12 \\ 6 \end{array} \right\}$   
 and that Quotient made less  $\left\{ \begin{array}{l} 9, \text{ the remainder} \\ \end{array} \right\}$   
 will be 83. *Quere my Age at the time of making*  
*this Question?*

*Answer, 42 Years.*

107. Th' Age of a Lady you quickly may find,  
 From what you observe\* hereunto's subjoin'd.

\* The Square of her Age being multiplied by it's  
 Cube and that Product divided by 320, the Square  
 Root of the Quotient will be 100.

*Answer, 20 Years.*

*New ARITHMETICAL PARADOXES*  
*for the Amusement of Youth.*

PARADOX I.

ONE and two, when they're wrote down-fair,  
 Will make one hundred I declare.

PARADOX 2.

Take one from nineteen, th' remainder you'll see  
 Is twenty exactly, pray how can this be.

PARADOX 3.

Prime numbers four, so wrote may be,  
 Just eighty eight, their sum you'll see;  
 But if from eighty eight you take  
 One o'th' numbers, then th' sum will make  
 No more (I say) than eighty three,  
 Pray tell me how this thing can be?

## P A R A D O X 4.

The sum of *four* figures in value will be,  
 Above *seven thousand, nine hundred and three* ;  
 But when they are halved, you'll find very fair,  
 The sum will be *nothing*, in truth to declare.

## P A R A D O X 5.

The sum of *nine* figures, a number will make,  
 From which if just *fifty* you're pleased to take,  
*One third* of that number remains still behind,  
 This number young *Tyro* be pleased to find ?

## P A R A D O X 6.

*Six hundred and sixty* so order'd may be,  
 That if you divide the whole number by *three*,  
 The quote will exactly in numbers express,  
 The half of *six hundred and sixty* not less.

## P A R A D O X 7.

Come tell to me, what figures *three*,  
 When multipli'd by *four*,  
 Make *five* exact, 'tis truth in fact,  
 This *Tyro* pray explore ?

## P A R A D O X 8.

George paid his *Uncle* as we find,  
*One hundred pounds* just to his mind :  
 To his *first Cousin Simon Reade*,  
 Just the same sum he likewise paid ;  
 But had in cash at first not more,  
 In *British* pounds, than just *five score*.  
 How this cou'd be, I pray explore. }

## P A R A D O X 9.

Just *one pound ten* \* will name a *Man*, \* *shill.*  
 His *Sign* likewise, 'tis not the *Swan* :  
 Come tell this *Landlord's Name and Sign*,  
 That *John* may know to call and dine.

P A R A -

P A R A D O X I O.

A famous *Quack Doctor*, of skill most profound,  
 Receiv'd of his patients just *one hundred pound*,  
 It being in silver, bids *Merry* his man,  
 To count it him over, as soon as he can;  
 He counted the money, then *Master* quoth he,  
 Here's *one hundred* for you, and *something* for me, }  
 You're wrong, (says the *Doctor*) that never can be. }  
 But soon he perceived his money made more,  
 By *Merryman's* method of counting it o'er:  
 So liking the fancy, said, take what remains,  
 It was more than *eight pounds* he got for his pains.  
 How *Merryman* counted the money declare,  
 To gain such a sum from *one hundred pound*—fair.

P A R A D O X I I.

Twelve *merry Men* did in my garden stand,  
 All in a row, upon this fertile land.  
 At equal distance plac'd—the row in view,  
 Was *twenty yards* in length, when measur'd true,  
 These Men replac'd,—stand in a row once more,  
 At the *same distance*, as they were before.  
 The length of ground, on which they fairly stand,  
 Is now no more than *thirteen yards* of land,  
 How is this done, come *Tyro* tell to me,  
 And with a *Laurel* you shall crowned be?

P A R A D O X I 2.

How in two parts must I divide  
 A board that's just *nine inches* wide,  
 And *sixteen* long, I pray declare,  
 To fill a hole just *one foot* square.

## C O N C L U S I O N.

To the *Tyro's* in A R I T H M E T I C.

**Y**E *British* Youths, with emulation strive,  
 And to this Port, or Page, you'll soon arrive.  
 The track so easy, ev'ry Rule so clear,  
 Nought can obstruct you to your Passage here.  
 No dang'rous Cliff, no Cape to weather round,  
 Quite smooth and easy, ev'ry Course is found.  
 That with delight you may the Harbour gain,  
 Where *Knowledge* spreads her Sails, & wafts the Main,  
 With golden breezes, to enamour Youth,  
 To catch the Gales of Reason, Sense and Truth.  
*Knowledge!* that dear refiner of the Soul,  
 Bids thought take wing, and fly beyond the Pole,  
 High thro' the Clouds, to soar above the Sky,  
 And prove Creation in a *Deity*.  
*Knowledge!* (like *Ariadne's* thread) leads thro',  
 Lab'rins of Learning, Studies ever new.

F I N I S.

## A D V E R T I S E M E N T.

**T**HE *Author* of this *Treatise* begs leave to return  
 his sincere Thanks to all those *Ladies* and *Gentlemen* (in Number above eight hundred) who have  
 been pleased to become Subscribers thereto, and  
 hopes they will excuse him for not publishing their  
 Names as he at first proposed, being prevented there-  
 from by the Book being carried to a greater Size  
 than the Price fixt upon it will bear, having, in order  
 to render every thing complete, extended its length  
 above.

above one hundred and fifty Pages more than it was at first intended to be, so that the whole has run him to above one fourth more in charge of Printing, &c. which he hopes his generous Subscribers will take into Consideration.—And further begs leave to inform them, and all other Lovers of Learning and Ingenuity, into whose Hands this may happen to come, that he will (*if proper Encouragement be given him*) continue and publish by Subscription, in half-Yearly Numbers, *The MUSES CABINET*, or *DELIGHTS for the INGENIOUS*.—This Work will consist of two Parts, and will contain a deal of *Amusement*, as well as *Instruction* for *both Sexes*. Part 1st will contain (in every Number) many *useful*, as well as *delightful Curiosities*, such as *Original Poems*, *moral and instructive Tales*, *New Enigmas*, *Rebus'es*, *Paradoxes*, *Queries*, &c. with Answers thereto by various Correspondents. Part 2d. will contain (by way of Recreations) every thing that is useful and required in *Practical Mensuration*; such as the *best and easiest Methods* to measure all kinds of *Artificers Work*, *Boards*, *Timber*, &c. also, to *survey Land*, *gauge all kinds of Vessels*, *measure Marl-Pits* and *Hay-Reeks*, also how to *Level*, *find Heights*, *Depths* and *Distances*, &c. with a great Variety of *new and useful Numerical Questions* by several Ingenious Correspondents, with the Answers thereto, in each succeeding Number.—This Work he hopes to complete in twelve Numbers, so as to make two handsome Volumes in large *Octavo*, every Number of this Work will be decorated with an elegant Copper-Plate, and the whole will be a *complete Repository* of the most useful Parts of *Practical Science* — The first Number of this Work lately published, having fallen into the Hands of several *Ladies* and *Gentlemen* in different Parts of the Kingdom, whose Abilities are eminent in the most polite Parts of Literature have given it their Approbation, and promised to furnish the Author with several valuable Manuscripts and proper Materials suitable for the Work, so that  
he

he hopes he shall be enabled to make it the most *delightful* as well as *instructive Miscellany* ever offer'd to the Public ——— As the Author intends to have no more Copies printed of the abovementioned *Miscellany* than what shall be subscribed for, he therefore desires those Persons who chuse to be Subscribers thereto, to send him their Names (*Post-Paid*) as soon as possible, that it may be ascertained what Number, of Copies of the second Number may be got printed by their most obedient

humble Servant,

*Whitchurch,*  
*June 7th, 1773.*
